2. The monetary unit or standard of value of the United States and Canada, containing 100 cents, and equal to about 4*s.* 1½*d.* English. In the United States it is represented in the currency by gold and silver coins and by notes; in Canada by notes only. A two-dollar gold coin is current in Newfoundland. This unit was established in the United States under the confederation of the States, by resolution of Congress, July 6th, 1787. It was represented by a silver piece, the coinage of which was authorized by the act of Congress, August 8th, 1786, by which was also established the decimal system of coinage. The coinage was not begun until two years after the law of April 2d, 1792, establishing the mint. That law provided for the coinage of "dollars or units, each to be of the value of a Spanish milled dollar," as that coin was then current, and to contain 371¼ grains of pure silver, or 416 grains of standard silver. The Spanish dollar above mentioned was that struck in Spanish America. Spanish-American dollars, and coins representing halves, quarters, eighths, and sixteenths of them (the last two known as *shillings* and *sixpences* in New York and some other States, and by other names elsewhere), were abundant in the United States during the latter part of the eighteenth and the first half of the nineteenth century. The Spanish dollar coined in Spain was rare, but the intrinsic value of the two coins was the same. By an act of January 18th,

Dollar of the United States, 1795.
(Size of the original.)

1837, the dollar was made to consist of 412½ grains ⁹⁄₁₀ fine, the quantity of pure silver remaining the same, 371¼ grains. This dollar, being worth in market value from 100 to 104 cents, went out of circulation. An act of March 3d, 1849, directed the coinage of gold dollars of 25.8 grains ⁹⁄₁₀ fine, 23.22 being pure gold; and by act of February 12th, 1873, this was declared the unit of value of the United States. The coinage of gold dollars was suspended by the act of September 26th, 1890. An act of February 28th, 1878, directed the Secretary of the Treasury to purchase silver bullion, not less than $2,000,000 nor more than $4,000,000 per month, and cause it to be coined into standard silver dollars. This was repealed by the (Sherman) act of July 14th, 1890, which provided for the purchase of 4,500,000 ounces of silver each month and the coinage of 2,000,000 ounces a month. This act was repealed in 1893. The coins representing fractional parts of the dollar are: in silver, the half-dollar and quarter-dollar, or 50-cent and 25-cent pieces, and the dime or 10-cent piece; in nickel, the half-dime or 5-cent piece (originally in silver, and inconveniently small); and in bronze, the cent (originally in copper, and much larger) and the 2-cent piece (until 1873). There was a 3-cent piece, coined in silver until 1873, and in nickel until 1890, which has been little used owing to its inconvenient smallness in both forms. By the term *dollar* in the United States notes is intended the coined dollar of the United States, a certain quantity in weight and fineness of gold or silver, authenticated as such by the stamp of the government. Sometimes abbreviated *dol.*, but commonly represented by the symbol $ (the dollar-mark) before the number. The coinage of the silver dollar ceased in 1904. See *coinage ratio*, under *coinage*.

The Almighty *Dollar*, that great object of universal devotion throughout our land.
Irving, The Creole Village.

The Congress of 1792 fixed the monetary unit of the United States in coin, gave it the name *Dollar*, made it the unit of the money of account in their offices and courts, [and] named also its multiples and fractions.

Dolmen.

A chamber the walls of which are formed of large unhewn stones set up on end, while the roof is formed of a single large stone: the whole structure was originally partly covered with earth: a term formerly used as synonymous with *cromlech*. The name is sometimes given also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is probably that known as the Pierre Couverte, near Saumur, in France. It is 64 feet long, 14 feet wide, and about 6 feet high, and consists of four upright stones on each side, one at each end, and four on the top. It is now generally believed that dolmens were sepulchres, although afterward they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of a primitive rude dwelling, and may sometimes have been the actual structure in which the savage sheltered himself, converted afterward into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Similar structures are found in various parts of the world, as in Hindustan, Circassia, etc.

2. In *law*, the place where a person has his home, or his principal home, or where he has his family residence and personal place of business; that residence from which there is no present intention to remove, or to which there is a general intention to return. Thus, a man may be a citizen of one country, have his domicile in another, and temporarily reside in a third. Domicile is of three kinds: 1st, *domicile of origin* or *nativity*, depending on that of the parents at the time of birth; 2d, *domicile of choice*, which is voluntarily acquired by the party; and 3d, *domicile by operation of law*, as that of a wife arising from marriage. The term *domicile* is sometimes used to signify the length of residence required by the law of some countries for the purpose of establishing jurisdiction in civil actions; in Scotland, residence for at least forty days within the country constitutes a domicile as to jurisdiction. All questions relating to personal property, in matters of debt, intestacy, or testamentary disposition, are determined by the law of the place of domicile, while those relating to real property are subject to the law of the place where it is situated. The property of a foreigner domiciled in a country with which his own is at war is held to be subject to seizure as that of an alien enemy.

It would be more correct to say that that place is properly the *domicil* of a person in which his habitation is fixed without any present intention of removing therefrom.

"Two things must concur," says the same eminent jurist [Story], "to constitute *domicile* — first, residence, and secondly, intention of making it the home of the party," and when once *domicile* is acquired it is not shaken off by occasional absences for the sake of business or of pleasure, or even by visits to a former *domicile* or to one's native country. *Woolsey*, Introd. to Inter. Law, § 67.

Dominical or **Sunday letter**, one of the seven letters A, B, C, D, E, F, G, used in calendars to mark the Sundays throughout the year. The first seven days of the year being marked by the above letters in their order, the following seven and all consecutive sets of seven days to the end of the year are similarly marked, except that in leap-years the 24th and 25th of February receive the same letter; so that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays of the year, except in leap-year, when after February 24th the dominical letter for the remainder of the year changes to the one preceding. (Many modern writers make the change of letter to occur after the end of February, the 29th taking no letter.) After twenty-eight years the same letters return in their order. The use of the dominical letter is primarily to aid in determining the date of Easter; but it may be used, by calculation, for finding the day of the week on which a given date falls in any year, past or future. To find the dominical letter of any year, let p, q, r, s, respectively, be the digits in the thousands', hundreds', tens', and units' places of the number of the year. Then, if the year is new style, find the sum $6p + 2q + 5r + 4s + 1$, and diminish it by the quotient of the year divided by 400 (neglecting the remainder). If it is old style, form the sum $3(p + 1) + q + 5r + 4s$. In either case increase the result by double the remainder after dividing the year by 4 (this remainder being taken as 4 for January and February of a leap-year). Divide the result by 7, and the remainder is the ordinal number of the dominical letter in the alphabet (the ordinal number of G being called 0).

The official name of the order is Fratres Prædicatores (rendered in English Friars Preachers, Preaching Brethren or Friars, Predicants, or Order of Preachers), preaching and instruction being the chief objects of its foundation. It was established by Dominic himself also in Italy and Spain, and spread rapidly in other countries. In England its members were called Black Friars, from their black cloaks, and in France Jacobins, from the church and hospital of St. Jacques (Jacobus), in which they were first established in Paris. Their rules, based upon those of St. Augustine, enjoin poverty, chastity, fasting, and silence; but the last two may be dispensed with when they would interfere with active duties. The officers of the order are all elective. The highest, holding his place six years, is termed general; provincial and conventual priors have charge respectively of provinces and convents. The Dominicans and Franciscans, originating about the same time and long vehement rivals, were the leading orders of the Roman Church until the rise of the Jesuits in the sixteenth century. They still exist in many countries, but with reduced influence. The dress of the order is a black mantle and a white habit and scapular. An order of Dominican nuns was also founded by Dominic.

Donatist (don'a-tist), *n.* [< LL. *Donatista*, Donatist, < *Donatus*, a man's name.] One of an early Christian sect in Africa which originated in a dispute over the election of Cæcilian to the see of Carthage, A. D. 311, occasioned by his opposition to the extreme reverence paid to relics of martyrs and to the sufferers for the Christian faith called confessors, and the rivalry of Secundus, primate of Numidia. Secundus and the Numidian bishops declared Cæcilian's consecration invalid because conferred by Felix of Aptunga, whom they charged with being a traditor. They excommunicated Cæcilian and his party, and made one Majorinus bishop in opposition. The name Donatist came either from Donatus of Casæ Nigræ, who headed the party of Majorinus at the Lateran Council in 313, where it was condemned, or (more probably) from Donatus "the Great," who succeeded Majorinus in 315 and under whom the schism became fixed. Repressed under Constans, the Donatists revived under the favor of Julian the Apostate. Repressive measures, provoked by their frequent acts of fanatical violence, were resorted to from time to time. These measures, internal schisms, the conciliatory conduct of the orthodox clergy at a conference held at Carthage in 411, and the arguments of St. Augustine caused many to abandon Donatism, and the sect became insignificant, though not entirely extinct till the seventh century. The Donatist party held that it constituted the whole and only true church, and that the baptisms and ordinations of the orthodox clergy were invalid because they were in communion with traditors. They therefore rebaptized and reordained converts from Catholicism. See *Circumcellion, Maximianist, Primianist, Rogatist.*

It consists of two volumes in vellum, a large folio containing 382 pages, and a quarto containing 450. They form a valuable record of the ownership, extent, and value of the lands of England (1) at the time of the survey, (2) at the date of bestowal when they had been granted by the king, and (3) at the time of Edward the Confessor, when a somewhat similar survey had been made; the numbers of tenants and dependents, amount of live stock, etc., were also returned. The book was long kept under three different locks in the Exchequer, along with the king's seal, but is now kept in the Public Record Office. In 1783 an edition printed from types made for the purpose was issued by the British government. The counties of Northumberland, Cumberland, Westmoreland, and Durham were not included in the survey. Repeating after the Clerk of Court, he gabbled over the words of the sentence, which condemned Euphemia Deans to be . . . conveyed to the common place of execution, and there hanged by the neck upon a gibbet. Doric cyma. See *cyma*, 1.—**Doric dialect.** See **II.**—**Doric mode.** See *mode*.—**Doric order,** in *arch.*, the oldest and strongest of the three Greek orders, in its external forms the simplest of all, but in its most perfect examples, especially as exhibited in the monuments of the age of Pericles at Athens, combining with solidity and force the most subtle and delicate refinement of outlines and proportions that architecture has known. In a de-

based and distorted form, the Doric constituted the second order of the Romans, coming between their Tuscan and Ionic. A characteristic of the Grecian Doric column is the absence of a base; the channelings are usually 20 in number, and in section approximate to a semi-ellipse; the capital has generally no astragal, but only one or more fillets or annulets, which separate the channelings from the echinus. The profile of the capital in the best examples is a carefully studied eccentric curve, neither flat enough to be hard in effect, nor full enough to be weak. The echinus prior to the time of perfection spread out far beyond the shaft; the later Greeks made it a frustum of a cone, and the Romans cut it as an ordinary quarter-round. In good Greek examples, as a rule, no horizontal lines are found in a Doric building, floor- and cornice-lines, etc., being curved slightly upward; the profiles of the column-shafts are slightly convex, and all columns are slightly inclined toward the center of the building. All these particularities have relation to optical effects so subtle that their influence is felt rather than seen.

The first of the Roman *orders* is the *Doric*, which, like everything else in this style, takes a place about half-way between the Tuscan wooden posts and the nobly simple order of the Greeks. *J. Fergusson*, Hist. Arch., I. 298.

Only the revenue belonged to the husband, and many minute rules . . . prevented him from spending it on objects foreign to the purpose of the settlement. 2. In *law*, the portion which the law allows to a widow for her life out of the real property in which her deceased husband held an estate of inheritance. At common law it is one third of such real property held by the husband at any time during the marriage as the common issue of the husband and wife might have inherited, except such property as has been conveyed with the concurrence of the wife. The wife may also bar the right of dower by accepting a jointure. By modifying statutes, in some of the United States, the dower is sometimes a share in fee, and sometimes extends only to property which the husband held at the time of his death. In England, by the Dower Act of 1833, the common-law rights of the wife have been greatly modified, her dower being entirely under the control of the husband. In the earlier periods of the common law several kinds of dower were usual, as *dower ad ostium ecclesiæ*, which was dower voluntarily pledged by the husband at the porch of the church where the marriage was solemnized; and in this case the share might be less than a third, or (except for a restriction at one time imposed for the protection of the interests of feudal lords) it might be more than a third. This was, sometimes at least, done by the declaration in the marriage service "with all my lands I thee endow," or the husband might specify a particular manor or other lands. If he had no lands, or chose to mention goods only, the declaration was, as now, "with all my worldly goods I thee endow," in which case the wife, if she survived him, was entitled to a third of the personal property left by him; and if he left lands, the law, notwithstanding his omission to promise dower in them, gave her what was called *reasonable dower*, or *dower according to custom*, viz., the life estate in one third as above described, unless she had accepted a jointure or other provision in lieu of dower.

The *dower* of lands in English law . . . belonged to a class of institutions widely spread over western Europe, very similar in general character, often designated as doarium, but differing considerably in detail.
Maine, Early Hist. of Institutions, p. 338.

At common law this is effected only by joining in the husband's deed of conveyance.—**To assign dower.** See *assign*.—**To bar dower**, to preclude the claiming of dower by a widow, as by her joining her husband in conveying during his life.—**Writ of dower**, a process for the establishing of the right of dower, or the recovery of the land by the widow.

4. *pl.* Specifically, certain districts in southern and southeastern England which are underlain by the Chalk (which see). These districts are considerably elevated above the adjacent areas, and are dry in consequence of the pervious nature of the underlying rock. The one is to the north, the other to the south, of an intermediate district known as the *Weald* (which see). Various other areas of similar character are called downs, and to this word there is often some geographical prefix, as the *Marlborough Downs*. A limited portion of this high, rolling region is often called *the down*.—**The Downs**, as a proper name, a roadstead on the coast of Kent in England, near the entrance to the strait of Dover, where the North Downs meet the coastline. It lies between the North and South Forelands, opposite Deal, Sandwich, and Ramsgate, inside of the shallow called the Goodwin Sands, and is an important shelter for shipping.

★ **draft**[1], **draught**[1] (dra̋ft), *n.* and *a.* [This word has changed in pron. from *draught* (ME. and mod. Sc. pron. dräċht) to *draft* (pron. dräft, dra̋ft), and the fact has been recognized by the spelling *draft*, which, dating from late ME., is now the established form in the military, commercial, and many technical uses, in which the literary traditions in favor of *draught* are less felt; in other uses the spelling *draught* still prevails, though *draft* is not uncommon in many of them. There is no rational distinction between the two forms; *draft* is on all accounts preferable. (The *f* represents the changed sound of the orig. guttural; a similar change is recognized in the spelling *dwarf*.) Early mod. E. usually *draught*, rarely *draft* (dial. also *drought*, *drait*: see *drought*[2], *drait*), < ME. *draught*, *draugt*, *drauht*, *draht*, also rarely *drafte*, also, with loss of the guttural, *drawte*, a drawing, pulling, pull, stroke, etc., not found in AS. (= MD. *draght*, *dracht*, D. *dragt* = MLG. LG. *dracht*, a load, burden, = MHG. *traht*, G. *tracht*, a load, = Icel. *drättr*, a pulling, draft of fishes), = OSw. *drækt*, Sw. *drägt* = Dan. *dragt*, a burden, litter, draft; with formative *-t*, < AS. *dragan*, draw, drag: see *draw*. The uses of *draft* are so numerous and involved that their exhibition in linear sequence is difficult. All the senses attached to the word in either spelling with their quotations are here necessarily exhibited together under *draft*[1], *draught*[1], although, of course, most of the obsolete senses are found only in the older spelling *draught* (in its various ME. forms). Modern senses in which the spelling *draught* is still prevalent over *draft* are indicated. In cases not so indicated, *draft* is the prevalent spelling. The compounds in which *draught* is the only recorded spelling are given under that spelling.] **I.** *n.* **1.** The act of drawing or dragging (in any sense); a drawing; a draw; a haul; a pull. 15. The drawing or moving of air; the air so drawn or moved; a confined current of air, as in a room or in the flue of a chimney. The draft of a chimney depends, apart from the mode of construction, on the difference of the density of the rarefied column inside the chimney, as compared with an equal column of the external atmosphere, or on the difference in height of the two columns of elastic fluid, supposing them reduced to the same standard of density. The velocity of the current is the same as that of a heavy body let fall from a height equal to the difference in height of two such aërial columns. Drafts may be produced or increased (*a*) by a blast which rarefies the air above the fire (a *blast-draft*), or (*b*) by blowers which compress the air beneath the fire (a *forced draft*). When a forced draft is used on a vessel, air is forced into the fire-room, which is closed in such a way that the air can find egress only through the furnaces and funnels. In some recent vessels increased draft has been secured by the partial exhaustion of the air in the uptakes and lower parts of the funnels, which causes an increased flow of air from the fire-room through the furnaces. This is called an *induced draft.*

A fabulous animal common to the conceptions of many primitive races and times, or, as in the Bible, an indefinite creature of great size or fierceness. When described or depicted, it is represented as either a monstrous serpent or a lizard (like an exaggerated crocodile), or a compound of both, or (as in heraldry) as a combination of mammalian and reptilian characters; but always as winged, with fiery eyes, crested head, and terrible claws. It is often represented as blood-red and spouting fire, and sometimes with several heads, like the Hydra; and in the myths of the Scandinavians and other races, dragons are often the guardians of treasures, etc. The killing of a dragon was reckoned among the greatest feats of heroes in both ancient and medieval times; thus, the legend of St. George and the dragon is one of the most celebrated in Christian literature. The dragon is the imperial emblem of China, and is regarded by the Chinese as a sort of divinity, but by other peoples generally as the type and embodiment of fierceness and cruelty or watchful malice. In the Apocalypse "the dragon, that old serpent" is a synonym of Satan (Rev. xx. 2). In the Old Testament it is either a large land-animal or a great marine fish (Isa. xxxiv. 13—revised version, jackal; Ps. lxxiv. 13—revised version, dragon), a venomous land-serpent (Ps. xci. 13—revised version, serpent), or the crocodile (Ezek. xxix. 3—revised version, dragon). The same Hebrew word, *thannim*, is also sometimes translated *whale* (Gen. i. 21—revised version, sea-monster; Job vii. 12—revised version, sea-monster). The extinct pterodactyl comes nearest of all known creatures to the most prevalent conception of a dragon.

It has a large frill on each side of the body, formed of skin stretched over six elongated hinder ribs, which like a parachute sustain the creature in the air for a few moments. The structure is not a wing, and the animal does not properly fly, the arrangement somewhat resembling that in the flying-squirrel, flying-lemur, etc. The species are confined to the old world. (*b*) Any one of the monitor-lizards. *Griffith's Cuvier.* (*c*) In *ornith.*, a kind of carrier-pigeon. Also called *dragoon.*

A similar standard was in use as late as the reign of Richard I. in England, and is especially mentioned as being in his crusading army. Also called *dragon-standard*. See *drake*[2], 2.

dram (dram), *n.* [Now also spelled *drachm*, after the L. spelling; < ME. *drame*, a dram (weight), < OF. *drame*, also spelled, in imitation of the L., *dragme, drachme*, mod. F. *drachme* = Sp. *dracma* = Pg. *drachma* = It. *dramma* = D. *drachma* = G. *drachme* = Dan. *drakme* (cf. Dan. *dram* in sense 4, < E.) = Sw. *drachma*, < L. *drachma*, ML. also *dragma*, < Gr. *δραχμή*, later also *δραγμή*, an Attic weight, a Grecian silver coin.] 1. A unit of weight less than an ounce. The dram is generally supposed to be of Greek origin. Many weights of this denomination and its multiples have been exhumed at Athens, belonging to different systems, of 57, 67, 75, and 78 grains troy, and there were doubtless others. The Solonic dram, the Athenian monetary weight, had at first 67.4, later 66.6 grains troy. The Æginetan weight was greater, and is fixed by the latest authorities as normally 97 grains. A dram afterward appears in Phenician systems as a half or quarter of a shekel; and under the Ptolemies there was in Egypt a dram of 54.6 grains troy. Under the early Roman emperors a dram was introduced into the Roman system as $\frac{1}{8}$ of an ounce, equal to 63.2 grains troy. This relation to the ounce has been preserved in several modern systems. Thus, in apothecaries' weight, a dram is $\frac{1}{8}$ of an ounce, or 60 grains, divided into 3 scruples of 20 grains each. The avoirdupois dram, however (derived from the Spanish *adarme*), is only $\frac{1}{16}$ of an ounce, or $27\frac{1}{2}$ grains. In the old Spanish apothecaries' weight a dram was $\frac{1}{4}$ of an ounce. In the Neapolitan system 10 drams made an ounce of $412\frac{1}{2}$ grains troy. The Nuremberg drachm was 57.5 grains troy. The Tuscan dramma was 54.6 grains troy. In the Arabian systems the dram is properly represented by the mitcal, but the derham is often called a dram, and was in fact derived from the Attic *drachma*. Abbreviated *dr*.

We are not dieted by *drachms* and scruples, for we cannot take too much. *Donne*, Letters, xxvii.

drama (drä′mä), *n.* [= F. *drame* = Sp. Pg. *drama* = It. *dramma* = D. G. Dan. *drama* = Sw. *dram*, drama (first in E., in the common heading of plays, *dramatis personæ*), < LL. *drama*, < Gr. *δρᾶμα* (τ-), a deed, act, an action represented on the stage, a drama, esp. a tragedy, < *δρᾶν* = Lith. *daraŭ*, do.] 1. A story put into action, or a story of human life told by actual representation of persons by persons, with imitation of language, voice, gesture, dress,

and accessories or surrounding conditions, the whole produced with reference to truth or probability, and with or without the aid of music, dancing, painting, and decoration; a play.

Westward the course of empire takes its way;
The four first acts already past,
A fifth shall close the *drama* with the day;
Time's noblest offspring is the last.
Bp. Berkeley, Arts and Learning in America.

A *drama* is the imitation (in a particular way) of an action regarded as one, and treated as complete. In the observation of the process of a complete action, and in the attempt to imitate it in accordance with such observation, must therefore be sought the beginnings of the *drama*. *A. W. Ward*, Eng. Dram. Lit., Int., p. xvii.

2. A composition in verse or prose, or in both, presenting in dialogue a course of human action, designed, or seemingly designed, to be spoken in character and represented on the stage; a form of imitated and represented action regulated by literary canons; the description of a story converted into the action of a play, and thereby constituting a department of literary art: as, the classic *drama;* the Hindu *drama;* the Elizabethan *drama*. The construction of such a composition is, as a general rule, marked by three stages: first, the opening of the movement; second, the growth or development of the action; third, the close or catastrophe, which must in all cases be the consequence of the action itself, as unfolded in acts, scenes, and situations. The drama, whether in actual life or mimic representation, assumes two principal forms, namely, tragedy and comedy; and from modifications or combinations of these result the mixed or minor forms, known as tragi-comedy, melodrama, lyric drama or grand opera, opera bouffe, farce, and burletta. Other forms, suggested by the subject and the manner of presenting it, are the nautical drama, the pastoral drama, the society drama, etc. Both tragedy and comedy attained a high degree of development in the ancient Greek drama, which originated in the worship of Bacchus.

Sophocles made the Greek *drama* as dramatic as was consistent with its original form. *Macaulay*, Milton.

It is sometimes supposed that the *drama* consists of incident. It consists of passion, which gives the actor his opportunity; and that passion must progressively increase, or the actor, as the piece proceeded, would be unable to carry the audience from a lower to a higher pitch of interest and emotion.
R. L. Stevenson, A Humble Remonstrance.

In the epic poem there is only one speaker—the poet himself. The action is bygone. The scene is described. The persons are spoken of as third persons. There are only two concerned in it, the poet and the reader. In the *drama* the action is present, the scene is visible, the persons are speakers, the sentiments and passions are theirs.
Dion Boucicault, in New York Herald, July 6, 1888.

3. Dramatic representation with its adjuncts; theatrical entertainment: as, he has a strong taste for the *drama*.

> *Sir J. Reynolds*, Discourses, i.

5. The art of a draftsman; the art governing the acts and methods included under sense 3.—6. The amount of money taken for sales in a shop or other trading establishment: usually in the plural. [Eng.]—**Chalk, crayon, pen, pencil, sepia, water-color,** etc., **drawing,** a drawing in the material or manner of the particular epithet, or the art or method of producing such a drawing. See *crayon*, *sepia*, *aquarelle*, *water-color*, etc.—**Charcoal drawing,** a method of drawing in black and white with prepared pieces of charcoal, or the work produced by this method. The paper, which should be of medium weight and regular grain, is first covered with an even flat tone. When the design has been sketched in, the darkest points are marked with a light touch of charcoal, and the highest light is formed by rubbing off the charcoal with a bit of dry bread, so that the extremes may not be lost sight of in establishing gradations. The subject is indicated in broad simple masses, and the delicate tones are blended and softened with a stump.—**Cut-line drawing,** in *stained-glass work*, a full-size cartoon or drawing on paper of the design, with the leads marked. The glass, being laid over this, is cut by following these lines. The same drawing serves afterward for leading up the work.—**Drawing from the round,** a drawing from a statue, a cast, or any other object in relief or in the round; or the art or practice of making such drawings.—**Drawing in two colors, in three colors,** etc., a drawing in not more than two colors, as in black and white, or in not more than three colors, etc. The drawing in three colors, or in three crayons or pencils, was much in vogue in the eighteenth century. It was a simplified form of pastel, executed on tinted paper, with a red or pink crayon for the flesh-tints, black for shadows, drapery, etc., and white for lights.—**Drawing on the block,** or **on the wood,** the process of drawing a picture, or a picture drawn, on a block of wood prepared for the engraver, who follows it in cutting the surface for printing.—**Finished drawing,** a drawing carefully worked out in detail, as distinguished from a rough drawing or a sketch.—**Free-hand drawing,** a drawing produced by the hand guided by the eye alone, without the use of any auxiliary instruments; or the art of making such drawings.—**Geometrical** or **mechanical drawing,** a drawing made with the aid of instruments, as compasses, scales, rulers, etc.; or the method or art of producing such a drawing. In drawing a building, or the like, by this method, the shadows are conventionalized geometrically, usually falling from left to right at an angle of 45°, and all rays of light are considered to be parallel.—**In drawing,** correctly drawn; symmetrical; in proportion: applied to a work of art or to a natural object, etc.—**Linear** or **line drawing,** a drawing executed strictly in lines or with a point.—**Monochrome drawing,** a drawing executed in one color only.—**Out of drawing,** incorrectly drawn; out of proportion; inharmonious. Compare *in drawing*.—**Wash-drawing,** a representation of an object produced by laying in the shades in flat washes, with merely the outlines and chief details put in in line; or the method, etc., of producing such a representation. This method is much used for architectural drawings, drawings of machines, industrial designs, etc.; and it is also largely practised in drawing on the block for engravers.

dredging-machine (drej'ing-ma-shēn'), *n.* An apparatus for lifting mud and silt from the bottoms of rivers, harbors, canals, etc. Some dredging-machines employ a single bivalve or clam-shell scoop; others a series of scoops on an endless chain; others some form of suction apparatus. The earliest form appears to have been a single box-like shovel or spoon, suspended from a crane rigged up on a large flat-boat. It was lowered into the mud, dragged along by means of ropes till filled, and then raised and emptied into the boat. Another early form is the chapelet or chain-pump, which, by means of an endless chain carrying buckets traveling in a trough, lifts mud and water, discharging them at the top into a flat alongside the machine. On this plan are now built some of the largest and most powerful dredging-machines in use. They consist of large, flat-bottomed

Dredging-machine.

boats, usually of iron, with a bucket-chain carrying nearly 40 buckets, each with a capacity of about 13 cubic feet. In excavating the Suez canal, the lifting buckets of some of the larger machines had a capacity of 5 cubic feet each, and the delivery was 20 buckets a minute. For the delivery of the sand or spoil both chutes and traveling buckets were used, the spoil being, in some instances, delivered 230 feet from the dredger. The clam-shell dredger is largely used in the United States, and has the merit of ease of management, the scoop operating in a half-circle about the boat, so that a wide channel can be excavated without moving the boat. The scoop is suspended from a crane at the bow of the boat, and is operated by means of chains controlled by steam-power, two long flexible poles serving as guides for the clam-shell. In the machines employing a suction or exhaust, a tube is lowered into the mud, and the mud and water are raised by means of a revolving disk in the tube, or by the aid of a vacuum or an ejector. A large vessel on the boat, being exhausted of air, is connected with the submerged pipe, when the mud and water readily rise into the receiver. In another form of pneumatic dredger a pipe is lowered into the silt and closed air-tight, and steam is then turned into the upper part of the pipe, driving out the air. Many other forms are used.

This is almost always done in water, and with the aid of suitable machinery. (See *cob*[7], *jig, buddle*[2].) The dressing of an ore, or the mechanical treatment, necessarily precedes the smelting, or chemical treatment. In the former it is chiefly the difference in specific gravity between the metalliferous portion of the vein and the veinstone itself of which advantage is taken for effecting a separation. In the chemical treatment the result depends on the various reactions which the substances present have with one another when exposed to a high temperature or smelted.

5. In *geol.*, loose detrital material, fragments of rock, boulders, sand, gravel, or clay, or a mixture of two or more of these deposits, resting on the surface of the bed-rock. The term *drift* was introduced by Lyell in 1840, to take the place of *diluvium*, with which latter word the idea of a universal deluge, and especially the Noachian deluge, had been generally associated. (See *diluvium*.) The word *drift* is now usually applied to detrital deposits when it is intended to include at the same time the transportation from a distance. Almost all detrital material has, however, been formed with more or less help from running water, and therefore must in that process have been moved to a greater or less distance from the place of its origin. It is especially with reference to material lying on the surface in northern Europe and northeastern North America that the term *drift* is used at present by geologists, and it is frequently called *northern drift*, since much of it has been moved in a southerly direction. And since ice is known to have been the principal agent by which this drift was moved, it is also denominated *glacial drift*. In modern usage the word 'drift' is almost never employed in any other sense than that of glacial drift. See *glacier* and *moraine*.

Such machines vary in form and size from a small hand-implement sowing one row to the gang-drill drawn by one or two horses, and heavy steam-power machines drawn by a rope from a traction-engine, as in steam-plowing. Horse-power drills are sometimes fitted with self-feeding devices for regulating the speed and the amount of feed from the hopper to the tubes that convey the seed to the ground. They all have some form of share or tool for opening or preparing the ground for the seed, immediately in front of the tube that distributes the seed. Its action is rapid, but it leaves a rough surface, and must be followed by a finishing-tool.—**Lip drill**, any flat drill upon the cutting edge of which a lip is formed, either by grinding or during the process of forging. The lip adds to the speed and cleanness of working.—**Persian drill.** (*a*) A hand-drill operated by a nut moved backward and forward over a quick screw on the stock of the drill. It is used to flatten or finish the bottoms of holes.—**Twist drill**, a cylindrical drill around the body of which is carried a deep spiral groove, so that the tool appears as if twisted from a flat bar. The point is sharpened to an obtuse angle. Such drills are used in all sizes, from a diameter of three inches down.—**Vertical drill**, a drill with a vertical spindle. *E. H. Knight.*—**Wall-drill**, a drilling-machine set up against a wall, and not fitted with a table to receive the work. drop-press (drop′pres), *n.* A swaging-, stamping-, or forging-machine having either a regular or an intermittent motion. It is essentially a power-hammer moving between vertical guides, and delivering a dead-stroke blow either from its own weight or by weight combined with power. In simple machines the weight is raised above the anvil by hand by means of a cord, and let fall; but as these machines are wasteful of labor they have been largely superseded by power-machines, in which the weight is raised by a strap wound over a drum, or by a wooden slat pressed between two pulleys revolving in opposite directions, or by direct connection with a wrist on a disk-wheel. The weight is either released at any point of its path by some simple device controlled by a lever within reach of the operator's hand or foot, or it descends by the movement of the disk. If a spring is interposed between the weight and the lifting apparatus, whatever its form, to absorb the recoil, it is called a *dead-stroke hammer* or *press*. In the drop-presses employing a strap or other lifting device that is released at the will of the operator, the blows are intermittent. Where the connection with a wheel is direct, the blows are regular and uniform so long as the machine works. All things shaped from hot metals on a drop-press, such as small parts of machines, are called *drop-forgings*. The drop-press is sometimes called simply *press*, and sometimes *drop-hammer*. It should not be confounded with the stamping-press, which, while it is allied to the drop-press, differs essentially in its manner of working.

drop-shutter (drop′shut″ėr), *n.* In *photog.*, a device for rendering the exposure of a plate in a camera very brief: used in instantaneous photography. The most simple form, also known as the *guillotine shutter*, and the one that gives a name to all other appliances of the kind, consists of two opaque pieces, each pierced with a hole, and arranged to slide one over the other. One of the pieces is fitted over the lens-tube, and when the openings in the two pieces are in line, the shutter admits light to the camera. When it is desired to make a very short exposure, the movable slide is raised till the opening of the tube is closed. On letting the slide fall, the opening in it passes before that in the fixed piece, and for an instant light is admitted to the plate behind the lens. To accelerate the fall of the slide, various devices are used, as springs or elastic bands. Improved drop-shutters have the form of revolving disks actuated by springs, etc., or that of flap-shutters controlled by a pneumatic device, etc.; and in many the opening is made to take place eccentrically, or the holes in the shutters are cut of various shapes, with the object of distributing the light, and giving a greater volume of light to the foreground or the lower portion of the picture, which is naturally not so well lighted as the higher portions.

Pacific islands and the arctic regions, and most abundantly in extratropical Australia. Their leaves have glandular hairs, which exude drops of a clear glutinous fluid that glitter in the sun; hence the name *Drosera*, and in English *sundew*. These glandular hairs retain small insects that touch them, and other hairs around those actually touched by the insect bend over and inclose it. The excitement of the glands induces the secretion of a digestive fluid, under the operation of which the nutritious nitrogenous matter of the insect is dissolved and absorbed. The European species have long been reputed a remedy for bronchitis and asthma.

A musical instrument of the percussive class, consisting of a hollow wooden or metallic body and a tightly stretched head of membrane which is struck with a stick. Three

A common word in Germany, adopted from the Slavic: the most important mining region of Germany being the Erzgebirge, on the borders of Bohemia. The word originally meant (in Slavic) 'brush,' and was applied to surfaces covered with projecting crystals like teeth, just as *comb* has been in English. Hence it also came to mean the cavities where such druses are found to occur. In English the word *druse* is little used at the present time except by mineralogists, and then chiefly in the adjective form *drusy* (which see). See also *geode.*

Druse[2] (dröz), *n.* [Turk. *Druzī.*] One of a people and religious sect of Syria, living chiefly in the mountain regions of Lebanon and Antilibanus and the district of Hauran. Macaulay, Hist. Eng., vii.

Macaulay's memory, like Niebuhr's, undoubtedly confounded not infrequently inference and fact; it exaggerated; it gave, not what was in the book, but what a vivid imagination inferred from the book. Sir George Lewis had none of this defect; his memory was a *dry* memory, just as his mind was a *dry* light; if he said a thing was at page 10, you might be sure it was at page 10.
W. Bagehot, On Sir G. C. Lewis.

Various processes for preparing dry plates have been experimented with almost since the earliest diffusion of photography; but most of these processes afforded plates of very uncertain quality, slow in operation, and exceedingly unreliable in their property of keeping. Dry plates have comparatively recently come into general use, in great measure superseding the old wet plates, owing to the adoption of gelatin as a medium for the sensitizing agent (bromide of silver), which is formed into an emulsion with the gelatin, and spread in a thin film upon some support, as glass, paper, or metal. Such plates require a remarkably short exposure to make a picture, are very convenient to handle, since the operator can make a number of exposures at one time and place, and can perform the chemical operations of development, etc., at his convenience, weeks afterward, if necessary, at any other place, instead of being forced, as with wet plates, to finish his picture at once. Moreover, the gelatin film is so tough that it is hardly necessary to varnish a dry-plate picture, as is indispensable with the tender collodion film; and these plates can be prepared commercially at small cost and of even quality. Their chief defect is that they cannot, as now made, be trusted to keep unimpaired in warm, damp weather, while unexposed or undeveloped, unless carefully protected from the air (in air-tight boxes).—**Dry process.** See *process.*—**Dry season**, a fishing season during which fish are scarce. [Local, New England.]—**Dry service.** See *dry mass*, under *mass*[1].—**Dry way**, a method of assaying by the aid of fire, or in a furnace or muffle: the opposite of assaying in the *humid way*, when the combination to be assayed, or, more properly, analyzed, exists in solution, or in the liquid form.—**High and dry.** See *high.*—**To boil dry.** See *boil*[2].

The value of the ducat varied but little, the coin usually containing from 3.42 to 3.44 grams of fine gold, worth from $2.27 to $2.32.

So *diver*, *dipper*, *dopper*, etc., names applied to diving birds.] 1. A lamellirostral natatorial bird of the family *Anatidæ* and subfamily *Anatinæ* or *Fuligulinæ* (which see). The technical distinction between any duck and other birds of the same family, as geese and mergansers, is not clear; but a duck may usually be recognized by the broad and flat bill, short legs, scutellate tarsi, and entirely feathered head. The common wild duck or mallard is *Anas boscas*, the feral stock of the domestic duck. The species of ducks are numerous, about 125, divided into some 40 modern genera, and found in nearly all parts of the world. Most ducks fall in one or the other of two series, fresh-water ducks or river-ducks, *Anatinæ*, and salt-water ducks or sea-ducks, *Fuligulinæ;* and from the latter a few are sometimes detached to form a third subfamily, *Erismaturinæ;* but the implied distinction in habits by no means holds good, since some or any river-ducks may be found in salt water, and few if any sea-ducks are entirely maritime. The mallard and closely related species now form the restricted genus *Anas*. Teal are small ducks, chiefly of the genus *Querquedula; Q. circia* is the garganey. The widgeons form the genus *Mareca;* the gadwalls, *Chaulelasmus;* the spoonbills, *Spatula;* the pintails or sprigtails, *Dafila*. Certain arboreal ducks of various parts of the world constitute the genus *Dendrocygna*. The muscovy duck or muskduck is *Cairina moschata*. The celebrated mandarin-duck of China and the wood-duck or summer duck of the United States are two species of the genus *Aix*, *A. galericulata* and *A. sponsa*. Sheldrakes or burrow-ducks are of the genus *Casarca* or *Tadorna*. A number of sea-ducks with black or red heads are placed in genera variously named *Fuligula*, *Fulix*, *Aithyia*, *Nyroca*, etc.; such are the scaups and pochards, the canvasback, and others. The buffleheads, goldeneyes, and whistlewings belong to a ge-

nus variously called *Clangula*, *Glaucion*, and *Bucephala*. The harlequin duck is *Histrionicus histrionicus* or *H. minutus*. The old-wife or long-tailed duck is *Harelda glacialis*. The Labrador duck, *Camptolæmus labradorius*, is notable as having recently become extinct; it is a near relative of the still common old squaw, *Clangula hyemalis*. Eiders are large sea-ducks of the genus *Somateria* and some related genera. Scoters and surf-ducks, also called sea-coots, are large black sea-ducks of the genus *Œdemia* and its subdivisions. The ruddy ducks belong to the genus *Erismatura* and some related genera. Fishing-ducks, so called, are not properly ducks, but mergansers (*Merginæ*).

The origin of the modern practice of dueling was doubtless the judicial combat or wager of battle resorted to in the middle ages as a means of settling disputes. The practice was formerly common, but has generally been suppressed by adverse public opinion in civilized countries. In England and the United States dueling is illegal, death resulting from this cause being regarded as murder, no matter how fair the combat may have been; and the seconds are liable to severe punishment as accessories. *Deliberate dueling* is where both parties meet avowedly with intent to murder. In law the offense of dueling consists in the invitation to fight; and the crime is complete on the delivery of a challenge.

2. In Great Britain, France, Italy, Spain, and Portugal, a hereditary title of nobility, ranking next below that of *prince*, but in some instances a sovereign title, as in those of the dukes of Burgundy, Normandy, Lorraine, etc. (see 3, below), or borne as his distinguishing title by a prince of the blood royal. The first English duke was Edward the Black Prince, created Duke of Cornwall in 1337. Dukes, when British peers, sit in the House of Lords by right of birth; Scotch and Irish dukes have a right of election to it, in common with other peers of those countries, in certain proportions; in other countries, except Germany (see below), the title conveys no prescriptive political power. In Great Britain a duke's coronet consists of a richly chased gold circle, having on its upper edge eight strawberry-leaves, with or without a cap of crimson velvet, closed at the top with a gold tassel, lined with sarcenet, and turned up with ermine.

Modena and Parma, in Italy, were ruled by sovereign dukes until their incorporation with the kingdom of Italy in 1860.

They have no stated places of worship, observe no holy days, reject the use of images and all rites and ceremonies, have no ordained clergy, and do not acknowledge the divinity of Christ or the authority of the Scriptures, to which they give, in so far as they accept them, a mystical interpretation. They were removed to the Caucasus in 1841 and subsequent years. As a result of Russian oppression, over seven thousand of them migrated to Canada in 1899.

dulcarnon†, *n.* A dilemma: as, *to be at dulcarnon*—that is, to be at a loss, to be uncertain what course to take; to be at one's wits' end. It is found in Chaucer:

> "I *am*, til God me bettere mynde sende,
> *At dulcarnon*, right at my wittes ende."
> Quod Pandarus, "Ye, nece, will ye here?
> *Dulcarnon* called is 'flemyng of wreches';
> It semeth hard, for wreches wol nought lere,
> For veray slouthe, or other wilful teches."
> *Troilus*, iii. 931.

Dulcarnon represents the Arabic *dhū 'l karnein*, 'lord of the two horns,' a name applied to Alexander, either because he boasted himself the son of Jupiter Ammon, and therefore had his coins stamped with horned images, or, as some say, because he had in his power the eastern and western world, signified in the two horns. (Selden's Preface to Drayton's Polyolbion.) But the epithet was also applied to the 47th proposition of Euclid, in which the squares of the two sides of the right-angled triangle stand out something like two horns. This proposition was confounded by Chaucer with the 5th proposition, the

famous *pons asinorum*. This, for some reason, was in the middle ages termed *Elefuga*, which is explained as meaning 'flight of the miserable,' or, as Chaucer renders it, 'flemyng of wreches.' *Ele* was supposed to be derived from *elegi*, meaning miserable, and this latter was itself derived from *elegia*, meaning sorrow. The passage from Chaucer was first thus explained in the London *Athenæum*, Sept. 23, 1871, p. 393.

dulce (duls), *a.* and *n.* [Altered to suit the orig. L.; early mod. E. *doulce*, earlier *douce*, < ME. *douce*, *dowce*, sweet, < L. *dulcis*, sweet: see *douce*.] **I.** *a.* Sweet; pleasant; soothing.

The tones are produced by striking the strings with hammers, the heads of which have both hard and soft sides, so that different qualities and degrees of force are possible. The dulcimer is a very ancient instrument. It is specially notable because it was the prototype of the pianoforte, which is essentially a keyed dulcimer—that is, a dulcimer whose hammers are operated by keys or levers. The immediate precursor of the pianoforte, however, the harpsichord, was a keyed psaltery. See *harpsichord*, *psaltery*, *pianoforte*.

Lastly, hyperdulia, which is only a subdivision of *dulia*, is that higher veneration which we give to the Blessed Virgin as the most exalted of mere creatures, though, of course, infinitely inferior to God, and incomparably inferior to Christ in his human nature.

The matters used for dyeing are obtained from vegetables, animals, and minerals; and the subjects to which they are applied are porous materials in general, but especially wool, cotton, silk, linen, hair, skins, feathers, ivory, wood, and marble. The great diversity of tint obtained in dyeing is the result of the combination of two or more simple coloring substances with one another or with certain chemical reagents. To render the colors permanent, the subsequent application of a mordant, or the precipitation of the coloring matter by the direct use of a mordant, is usually required; but when aniline and some other artificial dyes are used, no mordant is necessary. The superficial application of pigments to tissues by means of adhesive vehicles such as oil and albumen, as in painting or in some kinds of calico-printing, does not constitute dyeing, because the coloring bodies so applied do not penetrate the fiber, and are not intimately incorporated with it.

It consists of a paper ribbon arranged to pass under a series of recording pens, and moved by means of gearing from one of the axles of the car in which it is placed. The mechanical recording appliances give the tension on the draw-bar, showing the resistance of the car, its speed, the distance traveled absolutely, and in a given number of seconds, minutes, and hours. The oscillations of the car, also the level of the rails, the alinement, the condition of the joints of the rails, and the elevations of the rails at curves, are all mechanically traced on the paper band. Besides this, by simple electrical connections, the amount of water and coal consumed in the engine, the pressure of the steam, the mile-posts, stations, etc., are recorded from the car or from the engine, and all these records appear side by side upon the paper. The disruptive force of dynamite is estimated at about eight times that of gunpowder. Dynamite may be ignited with a match, and will burn quietly with a bright flame without any explosion. Large quantities have been known to fall 20 feet on a hard surface without explosion. It explodes with certainty when ignited by a percussion fuse containing fulminating mercury.

Dynamometers use the resistance of springs, weights, and friction as a test, each comparison being made with a known weight or force that will overcome the resistance of the spring, raise the weight, or balance the friction. One of the simplest forms is a steelyard in which the force to be measured is applied to the

Balance-dynamometer (elevation).

shorter arm while a weight is balanced on the longer graduated arm. The most common form of spring-dynamometer consists of an elliptical spring that may be compressed or pulled apart in the direction of its longer axis, with an index and scale, and sometimes a recording pencil, to indicate the amount of force exerted. In the apparatus depending on friction a brake is applied to the face of a pulley, and the force is measured by the resistance of the brake to the motion of the pulley. In other forms fast and loose pulleys are placed side by side and connected by weighted levers, a certain amount of force being required to lift the lever and communicate motion to both pulleys. In still other forms coiled springs are used to test a direct strain, as in moving a load or in towing. There are other forms used to test the recoil of guns and the explosive force of gunpowder. In the Batchelder dynamometer two pairs of bevel-wheels are interposed between the receiving and the transmitting pulleys, one pair in line with the pulleys, the other pair at right angles to them and in line with a balanced scale-beam. The force and resistance transmitted through the gears tend to turn the scale-beam about the line of the pulley-shafts, and this must be resisted by a weight upon the scale-beam, which is the measure of the force transmitted. The dynamometer is not a direct indicator of power exerted or of work performed; but when the velocity with which resistance is overcome or force transmitted has been determined by other means, this velocity, and the measure of the force obtained by the dynamometer, are the data for computing the power or work. See *balance-dynamometer, crusher-gage, piezometer*, and *pressure-gage*.—**Dynamometer coupling,** a device inserted in a shaft by means of which the power transmitted may be measured.

At some time or other, to be sure, all the beginners of *dynasties* were chosen by those who called them to govern.
Burke, Rev. in France.

It is to Manetho that we are indebted for that classification called by the Greeks *Dynasties*, a word applied generally to those sets of kings which belonged to one family, or who were derived from one original stock. These *Dynasties* were named as well as numbered, and their names were derived from the town, or region, whence the founder came or where he lived.

dyne (dīn), *n.* [Abbr. of *dynam*, < Gr. *δύναμις*, power: see *dynam.*] In *physics*, the unit of force in the centimeter-gram-second system, being that force which, acting on a gram for one second, generates a velocity of a centimeter per second; the product of a gram into a centimeter, divided by the square of a mean solar second. The force of a dyne is about equivalent to the weight of a milligram. It requires a force of about 445,000 dynes to support one pound of matter on the earth's surface in latitude 45°.

The *dyne* is about 1.02 times the weight of a milligramme at any part of the earth's surface; and the megadyne is about 1.02 times the weight of a kilogramme.

★**dysteleology** (dis-tel-ē-ol′ō-ji), *n.* [< Gr. *δυσ-*, bad, + *τέλος* (*τελε-*), end, purpose, + *-λογία*, < *λέγειν*, speak: see *teleology*.] The science of rudimentary or vestigial organs, apparently functionless or of no use or purpose in the economy of the organism, with reference to the doctrine of purposelessness. The idea is that many useless or even hurtful parts may be present in an organism in obedience to the law of heredity simply, and that such are evidences of the lack of design or purpose or "final cause" which the doctrines of teleology presume.

The Doctrine of Purposelessness, or *Dysteleology*.
Haeckel, Evol. of Man (trans.), I. 109.

It is no wonder that Mr. Romanes should avow his "total inability to understand why the phenomena of instinct should be more fatal to the doctrine of *Dysteleology* than any other of the phenomena of nature."
Fortnightly Rev., N. S., XXXIX. 63.

The *Dytiscidæ* are related to the ground-beetles or *Carabidæ*, but differ in the form of the metasternum, and in the structure of the legs, which are natatorial. They are water-beetles, mostly of large size, with narrowly oval depressed bodies and oar-like hind legs, found almost everywhere in fresh water.

Dytiscus, Dyticus (dī-tis′kus, dit′i-kus), *n.* [NL., orig. and commonly *Dytiscus* (Linnæus), *Dyticus* (Geoffroy, 1764), < Gr. *δυτικός*, able to dive, < *δύτης*, a diver, < *δύειν*, dive, sink, get into, enter.] The typical genus of predaceous water-beetles of the family *Dytiscidæ*, having the metasternal spiracles covered by the elytra, the front tarsi five-jointed, and patellate in the male, and the hind tarsi not ciliate, with the claws equal. The numerous species are large, but difficult to distinguish. They are dark olive-green above, the thorax and elytra being often margined with yellow. The elytra are smooth in the male, usually sulcate in the female. *D. marginalis* (Linnæus) is very abundant in Europe, inhabiting, like the other species, large bodies of stagnant water. E **1.** The fifth letter and second vowel in our alphabet. It has the same place in the order of the alphabet as the corresponding sign or character in the older alphabets, Latin and Greek and Phenician, from which ours is derived (see *A*); but the value originally attached to the sign has undergone much modification. The comparative scheme of forms (like that given for the preceding letters) is as follows:

Egyptian. Hieroglyphic. | Hieratic. | Phenician. | Early Greek and Latin.

From the capital E have come by gradual modification and variation (as in the case of the other letters) all the other printed and written forms. The value of the sign in the Semitic alphabets was and still is that of an aspiration, a peculiar smooth *h*. But when the alphabet was adapted to Greek use, this unnecessary aspirate-sign was utilized as a sign for a vowel-sound, either short or long, being nearly that instanced in our two words *met* and *they*. This double value in point of quantity it had in all early Greek use, and until in one section of the Greek race—and later, after their example, in all the others—it was found convenient to distinguish the long sound by a separate sign, H (see *H*), after which the E was restricted to denoting the short sound, as in our *met*. This distinction was not introduced into the Italican alphabets; hence the same sign stands for both short and long sound in Latin, and with us. The name of the sign in Phenician was *he* (of doubtful meaning; usually explained as 'window'); in Greek it was *εἶ*, and later *ἒ ψιλόν*, 'simple *e*'—it is believed, in antithesis to the double *αι*, which then had the same sound. In most of the languages of Europe the sign has retained its original Greek and Latin value; in the English it has done this only so far as concerns the short sound; the long sound has, in the history of the changes of pronunciation, so generally passed over into what was originally the long *i*-sound, that we now call this sound long *e* (as in *meet, mete, meat*, etc.). The proper *e*-sound (in *met, they*) is phonetically a medium between the completely open *a* of *father* and the close sound *i* of *pique*. In its two quantities (*met, they*) it constitutes about five per cent. of English utterance. Taking into account also the numerous digraphs, as *ea, ee, ei, ey, ae, ie, oe*, in which it is found, and its frequent occurrence as a silent letter, *e* is the most used of our alphabetic signs. This frequency is due in considerable measure to the general reduction of the vowels of endings to *e* that constitutes a conspicuous part of the change from Anglo-Saxon to English. The total loss then, further, of many of these endings in utterance has left numerous cases of silent final *e*, to which others have been added by analogy with these. A degree of value in the economy of our written speech belongs to it, in so far as its occurrence after a single consonant now almost regularly indicates the long sound of the vowel preceding that consonant, as in *mate, mete, mite, mo'e, mute;* but in many cases it appears also after a single consonant preceded by a short vowel, and such cases, as *give, live, have, vineyard*, constitute one of the classes where reform in orthography is most easily made, and has most to recommend it. (See *-e.*) E has further come to be used as an orthographic auxiliary, in some cases after *c* and *g*, where it is conventionally regarded as preserving the so-called "soft" sound of those letters, as in *peaceable, manageable.*

2. As a numeral, 250. *Du Cange.*—**3.** As a symbol: (*a*) In the calendar, the fifth of the dominical letters. (*b*) In *logic*, the sign of the universal negative proposition. See *A*[1], 2 (*b*). of the Phrygian mode in medieval music. (*b*) In the fixed system of solmization, the third tone of the scale, called *mi:* hence so named by French musicians. (*c*) On the keyboard of the pianoforte, the white key to the right of every group of two black keys. (*d*) The tone given by such a key, or a tone in unison with such a tone. (*e*) The degree of a staff assigned to such a key or tone; with the treble clef, the lower line and upper space (3). (*f*) A note on such a degree, indicating such a key or tone (4). —**5.** As an abbreviation: (*a*) East: as, *E.* by *S.*, east by south. See *S. E., E. S. E.*, etc. (*b*) In various phrase-abbreviations. See *e. g., i. e., E. and O. E.*, etc.—**E dur,** the key of E major.—**E moll,** the key of E minor.

e-[1]. A prefix of Anglo-Saxon origin, one of the forms of the original prefix *ge-*. It remains unfelt in *enough*. See *i-*.

e-[2]. [L. *ē-, ē,* reduced form of *ex-, ex:* see *ex-*.] A prefix of Latin origin, a reduced form of *ex-*, alternating with *ex-* before consonants, as in *evade, elude, emit*, etc. See *ex-*. In some scientific terms it denotes negation or privation, like Greek *ἀ-* privative (being then conventionally called *e-* privative): as, *ecaudate*, tailless, anurous; *edentate*, toothless, etc. In *elope* the prefix is an accommodated form of Dutch *ent-*.

-e. [ME. *-e, -en,* < AS. *-a, -e, -o, -u, -an, -en*, etc.] The unpronounced termination of many English words. Silent final *e* is of various origin, being the common representative (pronounced in earlier English) of almost all the Anglo-Saxon, Old French, Latin, etc., inflection-endings. In nouns and adjectives of native origin it may be regarded as representing the original vowel-ending of the nominative (as in *ale, tale, stake, rake*, etc.), or, more generally, the original oblique cases (dative, etc.), which from their greater frequency became in Middle English the accepted form of the nominative also, as in *lode, pole, mile, wile*, etc.; similarly, in words of Latin and other origin, as *rule, rude, spike, sprite*, etc. In verbs of native origin *-e* represents the original infinitive (AS. *-an*, ME. *-en, -e*) mixed with the present indicative, etc., as in *make, wake, write*, etc. In a great number of words the *-e* has disappeared as an actual sound, the letter being retained, as a result of phonetic and orthographic accident, as a conventional sign of "length"—an accented vowel followed by a single consonant before final silent *e* being regularly "long," as in *rate, write, rode, tube*, etc., words distinguished thus from forms with a "short" vowel, *rat, writ, rod, tub*, etc. In words of recent introduction *-e* is used whenever this distinction is to be made. In some cases the vowel preceding *-e* is short, as in *give, live, bade, have, javelin, vineyard*, etc., especially in polysyllables in *-ile, -ine, -ite*, etc., as *hostile, glycerine, opposite*, etc.; but some of these words were formerly or are now often spelled without the superfluous *e*, as *bad, glycerin, fibrin, deposit*, etc. Etymologically, final *e* in modern English has no weight or value, it being a mere chance whether it represents an original vowel or syllable.

-é. [F. *-é*, fem. *-ée*, pp. suffix, < L. *-ātus, -āta:* see *-ate*[1].] A French suffix, the termination of perfect participles, and of adjectives and nouns thence derived, some of which are used, though consciously as French words, in English, as *protégé, négligé, retroussé, dégagé, écarté*, etc. The Anglicized form is *-ec*[1] (which see).

ea. A common English digraph, introduced about the beginning of the sixteenth century, having then the sound of ā, and serving to distinguish *e* or *ee* with that sound from *e* or *ee* with the sound of ē. The original sound ā remained in most of the words having *ea* until the eighteenth century, and still prevails in *break, great, yea*, and in a dialectal ("Irish") pronunciation of *beast, please, mean*, etc. (which in dialect-writing are spelled so as to represent this pronunciation: see *baste*[4]); it has become ē in *bread*[1], *dread, head, meadow, heal'h, wealth, leather, weather*, etc., and, modified by the following *r*, in *bear*[1], *bear*[2], *heart, hearth, earth, learn*, etc. In most words, however, the digraph *ea* now agrees in sound with *ee*, namely, ē, as in *read*, pronounced the same as *reed* (but the preterit *read* like *red*). The modern digraph *ea* has no connection with the Anglo-Saxon and early Middle English diphthong or "breaking" *eá, ea*, though it happens to replace it in some words, as in *bread*[1] (Anglo-Saxon *breád*), *lead*[2] (Anglo-Saxon *leád*), *ear*[1] (Anglo-Saxon *eáre*).

ea. An abbreviation of *each*.

How *eagerly* ye follow my disgraces,
As if it fed ye! *Shak.,* Hen. VIII., iii. 2.

To the holy war how fast and *eagerly* did men go!
South, Sermons.

eagerness (ē′gėr-nes), *n.* 1†. Tartness; sourness; sharpness.—2. Keen or vehement desire in the pursuit or for the attainment of something, or a manifestation of such desire; ardent tendency; zeal; fervor: as, to pursue happiness or wealth with *eagerness; eagerness* of manner or speech.

She knew her distance, and did angle for me,
Madding my *eagerness* with her restraint.
Shak., All's Well, v. 3.

The *eagerness* and strong bent of the mind after knowledge, if not warily regulated, is often an hinderance to it.
Locke.

What we call our despair is often only the painful *eagerness* of unfed hope. *George Eliot,* Middlemarch, ii. 81.

=Syn. 2. *Earnestness, Avidity, Eagerness, Zeal, Enthusiasm,* ardor, vehemence, impetuosity, heartiness, longing, impatience. The first five words may all denote strong and worthy movements of feeling and purpose toward a desired object. In this field *eagerness* has either a physical or a moral application; with *avidity* the physical application is primary; *earnestness, zeal,* and *enthusiasm* have only the moral sense. *Avidity* represents a desire for food, primarily physical, figuratively mental: as, to read a new novel with *avidity;* it rarely goes beyond that degree of extension. *Eagerness* emphasizes an intense desire, generally for specific things, although it may stand also as a trait of character; it tends to produce corresponding keenness in the pursuit of its object. *Earnestness* denotes a more sober feeling, proceeding from reason, conviction of duty, or the less violent emotions, but likely to prove stronger and more permanent than any of the others. The word has at times a special reference to effort; it implies solidity, sincerity, energy, and conviction of the laudableness of the object sought; it is contrasted with *eagerness* in that it affects the whole character. *Zeal* is by derivation a bubbling up with heat; it is naturally, therefore, an active quality, passionate and yet generally sustained, an abiding ardor or fervent devotion in any unselfish cause. *Enthusiasm* is so far redeemed from its early suggestion of extravagance that it denotes presumably a trait of character more general than *eagerness* or *zeal,* more lively than *earnestness,* a lofty quickness of feeling and purpose in the pursuit of laudable things under the guidance of reason and conscience; thus it differs from *zeal,* which still generally implies a poorly balanced judgment.

The nobles in great *earnestness* are going
All to the senate-house. *Shak.,* Cor., iv. 6.

I lent her some modern works: all these she read with *avidity.* *Charlotte Brontë,* The Professor, xviii.

So Gawain, looking at the villainy done,
Forbore, but in his heat and *eagerness*
Trembled and quivered.
Tennyson, Pelleas and Ettarre.

It was the sense that the cause of education was the cause of religion itself that inspired Ælfred and Dunstan alike with their *zeal* for teaching.
J. R. Green, Conq. of Eng., p. 325.

Truth is never to be expected from authors whose understandings are warped with *enthusiasm;* for they judge all actions, and their causes, by their own perverse principles, and a crooked line can never be the measure of a straight one. *Dryden,* Ded. of Plutarch's Lives.

There is a certain *enthusiasm* in liberty, that makes human nature rise above itself in acts of bravery and heroism.
A. Hamilton, Works, II. 116.

★ **eagle** (ē′gl), *n.* [Early mod. E. also *egle;* < ME. *egle,* < OF. *egle, aigle,* F. *aigle* = Pr. *aigla* = Sp. *águila* = Pg. *aguia* = It. *aquila,* < L. *aquila,* an eagle (prob. so called from its dark-brown color), fem. of *aquilus,* dark-colored, brown (cf. Lith. *aklas,* blind): see *Aquila, aquiline,* etc. The native E. name is *earn:* see *earn*[3].] 1. Properly, a very large diurnal raptorial bird of the family *Falconidæ* and genus *Aquila* (which see), having the feet feathered to the toes, and no tooth to the bill, which is straight for the length of the cere. There are about 9 species, all confined to the old world except the golden eagle, *Aquila chrysaëtus,* which ranges also in North America. This is the type-species, to which the term originally attached; it is 3 feet or more in length, of a dark-brown color, deriving the epithet *golden* from the ruddy-brown feathers of the back of the neck. It preys on lambs, hares, rabbits, various birds, such as grouse, and carrion. Other notable species are the imperial eagle, *A. heliaca;* the Russian eagle, *A. mogilnik;* the spotted eagle, *A. maculata* (or *nævia*). From its size, strength, rapacity, and powers of flight and vision, the eagle has been called the king of birds; but its prowess is greatly exaggerated. By the ancients it was called the bird of Jove, and it was borne on the Roman standards. Many nations, as France under the Bonapartes, Austria, Prussia, and Russia, have adopted it as the national emblem. In heraldry it ranks as one of the most noble bearings in coat-armor.

Golden Eagle (*Aquila chrysaëtus*).

There myghte men the ryal *egle* fynde,
That with his sharpe lok persith the sunne;
And othere *eglis* of a lowere kynde,
Of whiche that clerkis wel devyse cunne.
Chaucer, Parliament of Fowls, l. 330.

So the struck *eagle,* stretched upon the plain,
No more through rolling clouds to soar again,
View'd his own feather on the fatal dart,
And wing'd the shaft that quiver'd in his heart.
Byron, English Bards and Scotch Reviewers, l. 826.

2. A member of the genus *Haliaëtus,* which comprises the fishing-eagles, sea-eagles, or earns, resembling the eagle proper in size and form, but having the shank bare of feathers and scaly: such as the white- or bald-headed eagle, or bald eagle, *H. leucocephalus,* the national emblem of the United States; the white-tailed eagle, *H. albicilla;* the pelagic eagle, *H. pelagicus,* etc.—3. A name of many raptorial birds larger than the hawk and the buzzard, only distantly related, as the harpy eagle, booted eagle, etc. A number of genera of such large hawks are sometimes grouped with the true eagles in a subfamily *Aquilinæ* (which see).

4. [*cap.*] An ancient northern constellation between Cygnus and Sagittarius, containing the bright star Altair. It seems to be shown on Babylonian stones of high antiquity, and the statement still current that it almost touches the equinoctial refers to the position of that circle about 2000 B. C. At present the constellation, enlarged by the addition of Antinoüs shortly after the Christian era, extends 20° north and 13° south of the equator. See *Aquila,* 2.

5. A military ensign or standard surmounted by the figure of an eagle. It is especially associated with ancient Rome, though borne, with various modifications, by certain modern nations, as France under the first and second empires.

This utter'd, overboard he leaps, and with his *Eagle* feircly advanc'd runs upon the Enemy.
Milton, Hist. Eng., ii.

And tamely see the Britons aid his foes?
See them secure the rebel Gaul supply;
Spurn his vain *eagles* and his power defy?
Langhorne, Cæsar's Dream.

The arms of the cross are of white enamel, with an eagle of red enamel between each two arms. The ribbon is striped orange-color and white.—**Order of the White Eagle,** an order founded at the beginning of the eighteenth century by Augustus II. of Poland and Saxony, or, as is alleged, revived by him. It has been adopted by the Czar of Russia, and is composed of one class only. The badge is a cross of 8 points, bearing a white eagle in relief, and surmounted by an imperial crown. The ribbon is sky-blue, but on state occasions the badge is worn pendent to a collar of white eagles connected by plain gold links.—**Spread eagle,** an eagle with outspread wings; specifically, the emblem of the United States of America: often applied attributively to any loud, bombastic, boastful, and arrogant display of national or other sentiments: as, a *spread-eagle* speech. They have a rough surface, and are essentially composed of concentric layers. The nodules often embrace at the center a kernel or nucleus, sometimes movable, and always differing from the exterior in color, density, and fracture. To these hollow nodules the Greeks gave the name of *eaglestones,* from a notion that the eagle transported them to her nest to facilitate the laying of her eggs. Also called *aetites.*

Bulg. Croatian, Serv. *ucho* = Bohem. Pol. *ucho* = Russ. *ukho* = Lith. *ausis* = OPruss. *ausins* (pl. acc.), ear; a general Indo-European name, prob. allied to Gr. *ἀίειν,* hear, perceive, L. *audire,* hear: see *audience, audit,* etc., *auscultate,* etc. Connection with *hear* doubtful: see *hear.*] 1. The organ of hearing; the apparatus of audition; the acoustic sense-organ; any mechanism by which an animal receives the impact of sound-waves and perceives them as sound. In man and mammals generally the ear consists of an *external ear,* which comprises (1) the more or less funnel-shaped pinna and (2) the external auditory meatus; of a *middle ear, ear-drum,* or *tympanum,* closed from the external auditory meatus by the tympanic membrane, traversed by a chain of small bones, the auditory ossicles, named *malleus, incus,* and *stapes,* and communicating with the pharynx by the Eustachian tube; and of an *internal ear,* or *labyrinth,* the essential organ of hearing, containing the end-organs of the auditory nerve. The labyrinth consists of a complicated closed sac, the membranous labyrinth, lined with epithelium and lying in a roughly corresponding excavation in the petrous bone, the bony labyrinth. The membranous labyrinth contains a limpid fluid, the *endolymph,* and between the membranous labyrinth and the bony labyrinth is a similar liquid called *perilymph.* The auditory nerve, penetrating the bone by the internal auditory meatus, is distributed to the walls of the membranous labyrinth. The labyrinth is completely shut off from the tympanum, but there are two fenestræ or openings, closed by membranes, in the tympanic wall of the bony labyrinth, and the foot of the stapes is applied to one of them. Sound-waves which impinge upon the tympanic membrane are transmitted across the tympanum by the chain of auditory ossicles, and thence into the labyrinth. In vertebrates below mammals the ear at once becomes simplified, as by lack of an external ear and reduction of the ossicles and of the labyrinth, the latter being simply ligulate or strap-shaped; and, as in fishes, the inner ear may contain one or more concretions, sometimes of great size, called *otoliths* or *ear-stones.* An ear of some kind is recognizable in the great majority of invertebrates. In its simplest recognizable expression it is a mere capsule or vesicle, containing some hard body answering to an otolith, and so supposed to have an auditory function. See *cochlea, labyrinth,* and cut under *tympanic.*

It is characterized in general by purity and simplicity of lines, combined with delicacy, refinement, and grace. The columns and shafts are more slender than those of the preceding style, and foliage in some instances sprouts out from the central pillar between the shafts; the moldings are more delicately curved, and are alternated with hollows so as to give beautiful effects of light and shade; the capitals frequently have the form of an inverted bell, and are often enriched with foliage, as of the trefoil, rising from the neck-molding and swelling outward beneath the abacus; the towers are loftier and are often crowned by spires; the buttresses project boldly; the vaults are groined, and the graceful wall-arcades often have their spandrels filled with sculpture. The most distinctive features of the Early English style, however, are the pointed arches

and long, narrow, lancet-headed windows, without mullions. Toward the end of the period the windows be-

=**Syn.** *Earnest, Pledge.* *Earnest,* like *pledge,* is security given for the doing of something definite in the future, and generally returned when the conditions of the contract have been fulfilled. In 2 Cor. i. 22 and v. 5 we read that the Spirit is given as the *earnest* of indefinite future favors from God; in Blackstone we find "a penny, or any portion of the goods delivered as *earnest.*" Whether literal or figurative, *earnest* is always a pledge in kind, a part paid or given in warrant that more of the same kind is forthcoming; as in "Macbeth," i. 3, Macbeth is hailed thane of Cawdor "for an *earnest* of a greater honor." See also "Cymbeline," i. 6. *Pledge* is often used figuratively for that which seems promised or indicated by the actions of the present, *earnest* being preferred for that which is of the same nature with the thing promised, and *pledge* for that which is materially different.

Man, if not yet fully installed in his powers, has given much *earnest* of his claims.

Among Orientals ear-rings have been used by both sexes from the earliest times. In England they were worn by the Romanized Britons and by Anglo-Saxons. After the tenth century the fashion seems to have declined throughout Europe, and ear-rings are neither found in graves nor seen in paintings or sculptures. The wearing of ear-rings was reintroduced into England in the sixteenth century, and Stubbs, writing in the time of Queen Elizabeth, says, "The women are not ashamed to make holes in their ears whereat they hang rings and other jewels of gold and precious stones." The use of ear-rings by women has continued to the present time. In the seventeenth century they were worn by men; and seafaring men, especially of the southern nations of Europe, have retained the use of them, commonly in the form of gold hoops, down to our own times. Among women the shape of ear-rings changes completely with the fashions, long, heavy pendants being succeeded by smaller ones, and these by single stones in almost invisible chatons, set close to the lobe of the ear.

Usually, but without much probability, referred to the √ **ar*, plow, whence *ear*[3], *earth*[2], *eard, arable*, etc.] **1.** The terraqueous globe which we inhabit. It is one of the planets of the solar system, being the third in order from the sun. The figure of the earth is approximately that of an ellipsoid of revolution or oblate spheroid, the axes of which measure 12,756,506 meters and 12,713,042 meters, or 7,926 statute miles and 1.041 yards, and 7,899 statute miles and 1,023 yards, respectively, thus making the compression 1:293: but these dimensions have a *probable* error of at least 200 yards, and a much greater possible error. The purely astronomical methods, as distinguished from geodetic, indicate a slightly smaller compression of about $\frac{1}{310}$. The radius of the earth, considered as a sphere, is 3,958 miles. The mean density of the whole earth is 5.5, or about twice that of the crust, and its interior is perhaps metallic. The earth rotates upon its axis in one sidereal day, which is 3 minutes and 55.91 seconds shorter than a mean solar day. Its axis remains nearly parallel to itself, but has a large but slow gyration which produces the precession of the equinoxes. The whole earth revolves about the sun in an ellipse in one sidereal year, which is 365 days, 6 hours, 9 minutes, and 9 seconds. The ecliptic, or plane of the earth's orbit, is inclined to the equator by 23° 27′ 12″.68 mean obliquity for January 0, 1899, according to Hansen. The earth is distant from the sun by about 93,000,000 miles.

"He stretched out the north over empty space;
He hanged the *earth* upon nothing."
Dawson, Nature and the Bible, p. 104.

It appears, . . . from what we know of the tides of the ocean, that the *earth* as a whole is more rigid than glass and therefore that no very large portion of its interior can be liquid.
Clerk Maxwell, Heat, p. 21.

2. The solid matter of the globe, in distinction from water and air; the materials composing the solid parts of the globe; hence, the firm land of the earth's surface; the ground: as, he fell to the *earth*.

God called the dry land *earth*. Gen. i. 10.

3. The loose material of the earth's surface; the disintegrated particles of solid matter, in distinction from rock; more particularly, the combinations of particles constituting soil, mold, or dust, as opposed to unmixed sand or clay. Earth, being regarded by ancient philosophers as simple, was called an element; and in popular language we still hear of the four elements, fire, air, earth, and water.

But live like an old badger in his *earth*.
Tennyson, Holy Grail.

7. In *chem.*, a name formerly given to certain inodorous, dry, and uninflammable substances which are metallic oxids, but were formerly regarded as elementary bodies. They are insoluble in water, difficultly fusible, and not easily reduced to the metallic state. The most important of them are alumina, zirconia, glucina, yttria, and thorina. The alkaline earths, baryta, strontia, lime, and magnesia, have more the properties of the alkalis, being somewhat soluble in water, and having an alkaline taste and reaction.

8. In *elect.*: (*a*) The union of any point of a telegraph-line, submarine cable, or any system of conductors charged with or conveying electricity with the ground. It is generally made by joining the point at which the earth is to be established by means of a good conductor with a metallic plate buried in moist earth, or with metallic water-pipes or gas-pipes, which, on account of their large surface of contact with the earth, usually afford excellent earth-connections. (*b*) A fault in a telegraph-line or cable, arising out of an accidental contact of some part of the metallic circuit with the earth or with more or less perfect conductors connected with the earth.—**Adamic earth.** See *Adamic*.—**Axis of the earth.** See *axis*[1].—**Bad earth**, in *elect.*, a connection with the earth in which great resistance is offered to the passage of the current.—**Black earth**, a kind of coal which is pounded fine and used by painters in fresco.—**Chian earth.** See *Chian*.—**Cologne earth**, a kind of light bastard ocher, of a deep-brown color, transparent, and durable in water-color painting. It is an earthy variety of lignite or partially fossilized wood, and occurs in an irregular bed from 30 to 50 feet deep near Cologne, whence the name.—**Compression of the earth.** See *compression*.—**Dead earth**, or **total earth**, in *elect.*, an earth-connection offering almost no resistance to the passage of the current, as when a telegraph-wire falls upon a railroad-track, or when the conductor of a submarine cable has a considerable surface in actual contact with the water.—**Earth of alum**, a substance obtained by precipitating the earth from alum dissolved in water by adding ammonia or potassa. It is used for paints.—**Earth of bone**, a phosphate of lime existing in bones after calcination.—**Ends of the earth.** See *end*.—**Figure of the earth**, the shape and size, not of the earth's surface, but of the mean sea-level continued under the land at the heights at which water would stand in canals open to the sea; also, the generalized figure or ellipsoid which most nearly coincides with the figure of the sea-level.

If Lactantius affirm that the *figure of the earth* is plane, or Austin deny there are antipodes, though venerable fathers of the church and ever to be honoured, yet will not their authorities prove sufficient to ground a belief thereon. *Sir T. Browne*, Vulg. Err., i. 7.

Good earth, in *elect.*, a connection with the earth in which the current meets with little resistance in its passage from the wire or conductor to the earth.—**Heavy earth.** Same as *baryta*.—**Intermittent earth**, in *elect.*, an earth-connection such as is produced by a wire touching at intervals conducting bodies in connection with the earth.—**Magnetic poles of the earth.** See *magnetic*.—**Partial earth**, in *elect.*, a poor earth-connection, such as exists when a telegraph-wire rests upon the ground, when its insulators are defective, or when it touches any conductor connected with the earth, but offering considerable resistance.—**To bring to the earth**†, to bury. *Eng. Gilds*.—**To put to earth**, in *elect.*, to join or connect a conductor with the earth.—**To run to earth**, in *hunting*, to chase the game, as a fox, to its hole or burrow.=**Syn. 1.** *Earth, World, Globe*. *Earth* is used as the distinctive name of our planet in the solar system, as Mercury, Venus, *Earth*, Mars, etc. It is used not only of soil, but of the planet regarded as material, and also as the home of the human race. (See Job i. 7; Ps. lviii. 11.) *World* has especial application to the earth as inhabited; hence we say, he is gone to a better *world*; are there other *worlds* besides this? It belongs, therefore, especially to the surface of the earth; hence we speak of sailing around the *world*, but not the *earth*. *Globe* makes prominent the roundness of the earth: as, to circumnavigate the *globe*.

The first man is of the *earth*, earthy. 1 Cor. xv. 47.

Such movements are of every degree of violence, from those that are scarcely perceptible without the aid of apparatus specially contrived for the purpose to those which overthrow buildings, rend the ground asunder, and destroy thousands of human lives. The duration of earthquakes is as variable as their intensity. Sometimes there is a single shock, lasting only a second or two; at other times a great number of shocks occur in succession, separated by greater or less intervals of time, the earth not being reduced to complete quiescence for weeks or even months. It is not known that any portion of the earth's surface is entirely exempt from earthquakes; but there are large areas where no very destructive ones have ever occurred, either in the memory of man or as recorded in history. The regions most frequently visited by destructive shocks are those where active volcanoes exist, those near high mountain-ranges, and those where the rocks are of recent geological age, and are much disturbed or uplifted. Such regions are the vicinity of the Mediterranean, the shores of the Pacific and the adjacent islands, the neighborhood of the Alps, and the East India islands. Regions not liable to strong seismic disturbances are the whole of northeastern North America, eastern South America, the north of Asia, and a large part of Africa. An earthquake-shock is a wave-like motion of a part of the earth's crust, and, in the words of Humboldt, is one of the ways in which the reaction of the interior of the earth against its exterior makes itself manifest. The most destructive earthquake of which we have any knowledge was that which destroyed Messina in Sicily and Reggio in Calabria, and surrounding villages, on December 28, 1908, causing the death of over 100,000 people. Minor shocks were felt for a considerable period thereafter. That of Lisbon, which killed about 60,000 people, began November 1, 1755, and was felt over that part of the earth's surface included between Iceland on the north, Mogador in Morocco on the south, Töplitz in Bohemia on the east, and the West India islands on the west. The disturbance continued, especially in the vicinity of the Mediterranean, with short intermissions, for several months. On November 18, 1755, the most violent shock occurred which has been felt in New England since its settlement by the whites. One of the most destructive earthquakes of recent occurrence was that which took place on the island of Ischia near Naples, July 28, 1883, by which over 2,000 persons perished. By the earthquake at Mendoza, South America, on the 20th of March, 1861, over 12,000 persons lost their lives. A violent earthquake, most destructive in Charleston, South Carolina, and vicinity, occurred on the night of August 31, 1886. A destructive earthquake visited San Francisco on April 18, 1906, causing a conflagration which destroyed a large part of the city. See *seismic, seismometer,* and *volcanism.*

The common name of the worms of the family *Lumbricidæ* (which see), and especially of the genus *Lumbricus,* of which there are several species, one of the best-known being *L. terrestris.* They belong to the order of oligochætous annelids. The earthworm has a cylindric vermiform body, tapering at both ends, segmented into a great number of rings, destitute of legs, eyes, or any appendages visible on ordinary inspection. It moves by the contraction of the successive segments of the body, aided by rows of bristles which are capable of being retracted. It is hermaphrodite, each individual of a pair impregnating the other in copulation, when the two are jointed in two places by their respective clitella. Earthworms are highly useful, giving a kind of under-tillage to the land, loosening the soil, and rendering it more permeable to the air. According to Darwin, in his work on "The Formation of Vegetable Mould," etc., earthworms, from their enormous numbers, exercise a highly important agency not only in this respect, but in the creation and aggregation of new soil, the burial and preservation (as also the original disintegration) of organic remains of all kinds, etc. They are food for many birds, mammals, and other animals, and their value for bait is well known to the angler, whence they are often called *angleworms* or *fishworms.* These worms are mostly a few inches long, but there are species attaining a length of a yard or more.

The people who inhabit the highlands of Southern Brazil have a firm belief in the existence of a gigantic *earthworm* fifty yards or more in length, five in breadth, covered with bones as with a coat-of-mail, and of such strength as to be able to uproot great pine-trees as though they were blades of grass, and to throw up such quantities of clay in making its way underground as to dam up streams and divert them into new courses. This redoubtable monster is known as the "Minhocao." *Pop. Sci. Mo.,* XIII. 508.

It corresponds with the Passover of the Jews, which in the King James version of the Bible is called once by the name of *Easter* (Acts xii. 4). The name appears several times in earlier versions. Easter is observed by the Greek, Roman Catholic, Episcopal, and Lutheran churches, and by many among the non-liturgical churches who do not generally regard the church year. The esteem in which it is held is indicated by its ancient title, "the great day." Easter is the Sunday which follows that 14th day of the calendar moon which falls upon or next after the 21st day of March. This is true both of old style and new, and the rule has been used, though not universally, from a very early day.

The northern Irish and Scottish, together with the Picts, observed the custom of the Britons, keeping their *Easter* upon the Sunday that fell between the xiv. and the xx. day of the Moon.

Gauss's Rule for finding the date of Easter. First, take x and y out of the following table:

	x	y
Old style	15	6
New style, A. D. 1583–1699	22	2
" " 1700–1799	23	3
" " 1800–1899	23	4
" " 1900–2099	24	5.

Second, calculate the five numbers a, b, c, d, e, by the following rules, where N is the number of the year:

a is the remainder after the division of N by 19.
b is the remainder after the division of N by 4.
c is the remainder after the division of N by 7.
d is the remainder after the division of $19a + x$ by 30.
e is the remainder after the division of $2b + 4c + 6d + y$ by 7.

Third, then $d + e + 22$ is the day of March, or $d + e - 9$ is the day of April on which Easter falls, except that when this rule gives April 26th the true day is April 19th, and when the rule gives April 25th, if $d = 28$ and $a > 10$, then the true date is April 18th.

During this vigil the churches, and frequently the streets, were brilliantly lighted, the worshipers also bringing lamps and tapers with them. Mr. Brookfield presents an amusing type of a prolix and *ebullient* old actor. *Athenæum*, Jan. 14, 1888, p. 60.

ebullioscope (ē-bul′yō-skōp), *n.* [= F. *ébullioscope*, irreg. < L. *ebullire*, boil up, + Gr. *σκοπεῖν*, view.] An instrument by which the strength of spirit of wine is determined by the careful determination of its boiling-point.

ebullition (eb-u-lish′on), *n.* [= OF. *ebullicion*, F. *ébullition* = Pr. *ebullicio* = Sp. *ebulición*, *ebullición* = Pg. *ebullição* = It. *ebullizione*, < LL. *ebullitio(n-)*, < L. *ebullire*, boil up: see *ebullient*.] **1.** The bubbling up or agitation which results from the action of heat on a liquid, owing to the lowest portions becoming gaseous and escaping; a boiling up or over. The temperature at which ebullition takes place varies with the liquid, and with the pressure to which the liquid is subjected, being higher when the pressure is increased, and lower when it is diminished. See *boiling-point*.

It is possible to heat water 20° F. above its boiling-point without *ebullition*. *Clerk Maxwell*, Heat, p. 25.

2. Any similar agitation, bubbling up, or disturbed or seething condition or appearance, produced by causes other than heat, as when rapidly flowing water encounters numerous obstacles or contrary currents.

The chafing of the water against these huge obstacles [rocks of granite], the meeting of the contrary currents one with another, creates such a violent *ebullition*, . . . that it fills the mind with confusion.
Bruce, Source of the Nile, I. 156.

3. Effervescence occasioned by fermentation or by any other process which causes the evolution of an aëriform fluid, as in the mixture of an acid with a carbonated alkali. [In this sense formerly *bullition*.]

We cannot find it to hold neither in iron or copper, which is dissolved with less *ebullition*.
Sir T. Browne, Vulg. Err., iv. 7.

4. Figuratively, an outward display of feeling; a sudden burst; a pouring forth; an overflowing: as, an *ebullition* of passion.

The greatest *ebullitions* of the imagination. *Johnson*.

Disposed to refer this to inexperience, or the *ebullition* of youthful spirit. *Prescott*, Ferd. and Isa., i. 3.

It was not an extravagant *ebullition* of feeling, but might have been calculated on by any one acquainted with the spirits of our community.
Emerson, Hist. Discourse at Concord.

=Syn. *Ebullition*, *Effervescence*, *Fermentation*. *Ebullition* is a boiling out or up; the word may be applied figuratively to that which suggests heated or intense activity. *Effervescence* is not the result of heat or of the escape of steam, but of the escape of gas from a liquid. *Fermentation* is a process often invisible, often taking place in solids, and sometimes producing *effervescence* in liquids.

ebulumt, ebulust (eb′ū-lum, -lus), *n.* [L., the herb dwarf elder.] A name for elderberry wine.

Eburna (ē-bėr′nä), *n.* [NL., fem. of L. *eburnus*, of ivory, < *ebur*, ivory: see *ivory*.] A genus of gastropods, variously limited. (*a*) By Lamarck it was made to include the ivory-shell *E. glabrata*, as well as turreted species of the family *Buccinidæ*. (*b*) By most later writers the typical species has been referred to the *Olividæ* and the genus restricted to buccinids, like *E. spirata*, which are by others designated as the genus *Latruncula*. As thus limited, it is remarkable for the oblong-ovate form, turreted spire, and flattish upper or sutural surface of the whorls, deep umbilicus, and thick porcellanous texture. The color is also characteristic, reddish spots being distributed on a white ground. (*c*) By a few the genus is restricted to the ivory-shell *E. glabrata*, by others called *Dipsacus*. There are about 14 species, found in China, etc.; some are used for food.

Ivory-shell (*Eburna spirata*).

It includes those brachiopods the bivalve shell of which has no hinge and little if any difference between the dorsal and ventral valves, and contains the families *Lingulidæ*, *Discinidæ*, and *Craniidæ*, which are thus collectively distinguished from the *Testicardines*. The term is synonymous with *Lyopomata*, *Inarticulata*, *Pleuropygia*, and *Sarcobrachiata*, all of which are names of this division of brachiopods.

écarté (ā-kär-tā′), *n.* [F., lit. discarded, pp. of *écarter*, discard, set aside, < *é-*, < L. *ex*, out, + *carte*, card: see *card*¹, and cf. *discard*.] A game played by two persons with thirty-two cards, the small cards from two to six inclusive being excluded. The players having cut for the deal, which is decided by the highest card, the dealer gives five cards to each player, three and two at a time, and turns up the eleventh card for trump. If he turns up a king, he scores one; and if the king of trumps occurs in the hand of either player, the holder may score one by announcing it before playing. The cards rank as follows: king (highest), queen, knave, ace, ten, etc. A player having a higher card of the suit led must take the trick with such a card; if he cannot follow suit, he may play a trump or not, as he chooses. Three tricks count one point, five tricks (called a *vole*) two points, and five points make game. Before play begins the non-dealer may propose—that is, claim the right to discard (*écarter*) any of the cards in his hand, and have them replaced with fresh ones from the pack. Should he do so, both can discard as many cards as they choose.

Ecaudata (ē-kâ-dā′tä), *n. pl.* [NL., neut. pl. of *ecaudatus*: see *ecaudate*.] In *herpet.*, the *Anura* or tailless batrachians: opposed to *Caudata* or *Urodela*.

Squirting Cucumber (*Ecballium Elaterium*).

named because the fruit when ripe separates suddenly from its stalk, and at the same moment forcibly expels the seeds and juice from the aperture left at the base. A precipitate obtained from the juice is the elaterium of medicine, a very powerful hydragogue cathartic. See *elaterium*.

ecbasis (ek′bā-sis), *n.* [= F. *ecbase*, < L. *ecbasis*, < Gr. *ἔκβασις*, a going out, issue, event, < *ἐκβαίνειν*, go out, come out, happen, < *ἐκ*, out, + *βαίνειν*, go, = E. *come*: see *base*2, *basis*.] An argument drawn from the relation of cause and effect; especially, an argument for or against a certain course of action, such as the passage of a proposed bill or law, from a consideration of probable consequences.

ecbatic (ek-bat′ik), *a.* [< Gr. as if **ἐκβατικός*, < *ἐκβαίνειν*, happen: see *ecbasis*.] Relating to an event that has happened; denoting a mere result or consequence, as distinguished from *telic*, which implies purpose or intention. Thus, the sentence "Events fell out *so that* the prophecy *was* fulfilled" is *ecbatic;* but the sentence "Events were arranged *in order that* the prophecy *might be* fulfilled" is *telic*.

ecce homo (ek′sē hō′mō). [L.: *ecce*, a demonstrative adv. or interj., here (he or it is)! lo! behold! prob. orig. **ece*, < **e*, locative of pron. *i-s, e-a, i-d*, this, he, she, it, + demonstrative suffix *-ce; homo:* see *Homo*.] Behold the man: a phrase commonly used to denote Christ crowned with thorns, considered as a subject for a work of painting or sculpture, from the words with which he was presented by Pilate to the Jews (John xix. 5). This subject has been frequently chosen by artists since the fifteenth century, among its most celebrated examples being paintings by Correggio, Titian, H. Caracci, Guido Reni, Van Dyck, and Guercino.

ecceity (ek-sē′i-ti), *n.* [< ML. *ecceitas* (occurring in the 16th century as a modification of the earlier *hæcceitas*, due to the fact that the formation of the latter word was not understood), < L. *ecce*, lo! in LL. and ML. an assistant pron. or adv., this, here: see *ecce homo*.] Same as ★*hæcceity*.

eccentric (ek-sen′trik), *a.* and *n.* [Formerly also *eccentrick;* = F. *excentrique* = Pr. *excentric* = Sp. *excéntrico* = Pg. *excentrico* = It. *eccentrico* = D. *excentriek* (cf. D. *excentrisch* = G. *excentrisch* = Dan. Sw. *excentrisk*), < NL. *eccentricus*, < LL. *eccentros*, < Gr. *ἔκκεντρος*, out of the center, < *ἐκ*, out, + *κέντρον*, center: see *center*1.] I. *a.* 1. Not located or situated in the center; away from the center or axis: as, in botany, lateral embryos and the stipes of some hymenomycetous fungi are said to be *eccentric*.

The astronomers discover in the earth no centre of the universe, but an *eccentric* speck.
Huxley, Lay Sermons, p. 16.

A complete neural circulation, however, is by no means the necessary condition of a sensibility independently located in *eccentric* portions of the human body such as Mr. Lewes supposes. *G. S. Hall*, German Culture, p. 234.

2. In *med.*, not originating or existing in the center or central parts; due to peripheral causes: as, *eccentric* irritation; *eccentric* convulsions (that is, convulsions due to peripheral irritation).—3. Not coincident as regards center; specifically, in *geom.*, not having the same center: applied to circles and spheres which have not the same center, and consequently are not parallel: opposed to *concentric*, having a common center. Hence—4. Not coincident as regards course or aim; tending to a different end or result; devious.

Whatsoever affairs pass such a man's hands, he crooketh them to his own ends, which must needs be often *eccentric* to the ends of his master or State.
Bacon, Wisdom for a Man's Self (ed. 1887).

Women's Affections are *eccentrick* to common Apprehension; whereof the two poles are Passion and Inconstansy.

In reason's sober orbit bid it roll.
Whitehead, On Churchill.

6. Of or pertaining to an eccentric: as, the *eccentric* anomaly of a planet; the *eccentric* rod of a steam-engine.

In senses 3 and 6 sometimes written *excentric*.

Eccentric angle, in *geom.*, an angle connected with an ellipse and defined as follows: Let ABDE be an ellipse. Upon the transverse axis AB as a diameter erect the circle ABFG. Then, taking any point on the ellipse, as H, let fall the perpendicular HK upon the transverse axis AB, and continue this perpendicular until it cuts the circle at the point L on the same side of the transverse axis AB. Join L with the common center, C, of the ellipse and circle. Then, the angle BCL, reckoned from one determinate end, B, of the transverse axis, is called the *eccentric angle* of the point H. The expression is derived from *eccentric anomaly*.—**Eccentric anomaly.** See *anomaly*.—**Eccentric cam,** a circular disk used as a cam, in which the center of rotation is outside the center of figure.—**Eccentric chuck.** See *chuck*4.—**Eccentric circle.** Same as II., 1.—**Eccentric cutter.** See *cutter*1.—**Eccentric equation.** Same as *equation of the eccentric* (which see, under *equation*).—**Eccentric equator.** Same as *equant*.—**Eccentric hypertrophy of the heart.** See *hypertrophy*.—**Eccentric place** of a planet, its place as seen from the center of its orbit.—**Eccentric theory,** a theory of the sun's motion which uses an eccentric in place of an epicycle.—**Eccentric wheel,** a wheel which is fixed on an axis that does not pass through the center. Its action is that of a crank of the same length as the eccentricity. See II., 2.

Eccentric Angle.

=**Syn. 5.** *Eccentric, Singular, Strange, Odd, Queer, Whimsical*, peculiar, erratic. *Eccentric* is applied to acts which are the effects of tastes, prejudices, judgments, etc., not merely different from those of ordinary people, but largely unaccountable and often irregular, or to the person who thus acts. *Singular* implies that a thing stands alone in its kind or approximately so; practically, the word expresses some disapprobation: as, a *singular* fellow or performance; while *eccentric* people are generally the objects of good-humored interest. *Strange* implies that the thing or its cause is unknown: as, a very *strange* proceeding; a *strange* insect; but what is *strange* to one man may not be so to another; what is *strange* to most or all is *singular*. *Odd*, unmated, starts from the same idea as *singular;* when applied to personal appearance, it implies singularity and grotesqueness: as, an *odd* figure; when applied to the mind or habits, it is nearly equivalent to *eccentric*, but is somewhat stronger: as, he is very *odd;* he has *odd* ways; when applied to actions or conditions, it frequently implies some degree of wonder, and is then nearly the same as *surprising:* as, it is *odd* that he does not write. *Queer* often expresses a singularity that is droll. *Whimsical* is nearer to *eccentric*, applying to one who often acts upon capricious and irregular fancies of a rather amusing kind. For connection with *quaint*, see *ancient*. See also *wonderful, irregular, fanciful*.

Yet in all these scores [of Shakspere's characters] hardly one . . . is to be found which deviates widely from the common standard, and which we should call very *eccentric* if we met it in real life. *Macaulay*, Madame D'Arblay.

The vulgar thus through imitation err;
As oft the learn'd by being *singular*.

Was just not ugly, and was just not mad.

But the old three-cornered hat,
And the breeches, and all that,
Are so *queer*.
O. W. Holmes, The Last Leaf.

Birds frequently perish from sudden changes in our *whimsical* spring weather, of which they have no foreboding. *Lowell*, Study Windows, p. 6.

II. *n.* 1. (*a*) In *anc. astron.*, a circle having its center remote from the earth and carrying an epicycle which in its turn was supposed to carry a planet.

Or if they list to try
Conjecture, he his fabric of the heavens
Hath left to their disputes; perhaps to move
His laughter at their quaint opinions wide
Hereafter, when they come to model heaven
And calculate the stars; how they will wield
The mighty frame; how build, unbuild, contrive,
To save appearances; how gird the sphere
With centric and *eccentric* scribbled o'er,
Cycle and epicycle, orb in orb. *Milton*, P. L., viii. 83.

(*b*) In *mod. astron.*, a circle described about the center of an elliptical orbit, with half the major axis for radius.—2. In *mech.*, a device for converting a circular motion into a reciprocating rectilinear motion. It acts upon the body moved by it through its perimeter like a cam, with which it is sometimes classed; but all its peculiarities of motion are essentially those of a crank-motion, and it may be considered as a crank having a pin of larger diameter than the throw. In the steam-engine it is a disk fitted to the shaft, with its center placed at one side of the center of the shaft, and it acts to convert the rotary motion of the shaft into the reciprocating motion of the valve-gear of the cylinder, and thus to make the engine self-acting. (See *link-motion, reversing-gear,* and *cut-off*.) In this sense sometimes written *excentric*.

3. One who or that which is irregular or anomalous in action; a person of eccentric habits.

Mr. Farquhar added another to his gallery of middle-aged *eccentrics*. *Athenæum*, Jan. 14, 1888, p. 60.

Angular advance of an eccentric. See *angular*.—**Eccentric of the eccentric,** a circle whose center is remote from the earth (in the Ptolemaic theory) or from the sun (in the Copernican), and which carries round its circumference a second circle, called the *eccentric*, and this again a third, called the *epicycle*, which carries a planet. An *eccentric of an eccentric* was supposed by Ptolemy to explain the motion of Mercury, and by Copernicus to explain the motions of Mercury and Venus. Tycho suggested such an explanation for the motions of Mars.—**Equation of the eccentric.** See *equation*.

eccentrical (ek-sen′tri-kal), *a.* Same as *eccentric*.

eccentrically (ek-sen′tri-kal-i), *adv.* With eccentricity; in an eccentric manner or position. Also *excentrically*.

Swift, Rab'lais, and that favourite child,
Who, less *eccentrically* wild,
Inverts the misanthropic plan,
And, hating vices, hates not man.
Lloyd, Familiar Epistle.

eccentric-gear (ek-sen′trik-gēr), *n.* In *mech.*, a term including all the links and other parts which transmit the motion of an eccentric.

eccentric-hoop (ek-sen′trik-hōp), *n.* Same as *eccentric-strap*.

Sw. *excentricitet*, < NL. *eccentricita(t-)s*, < *eccentricus*, eccentric: see *eccentric*.] 1. Deviation from a center; the state of a circle with reference to its center not coinciding with that of another circle.—2. In *geom.* and *astron.*, the distance between the foci of a conic divided by the transverse diameter. The eccentricity of the earth's orbit is .01677, or about $\frac{1}{60}$.—3. In *anc. astron.*, the distance of the center of the equant from the earth.—4. Departure or deviation from that which is stated, regular, or usual; oddity; whimsicalness: as, the *eccentricity* of a man's genius or conduct.

Akenside was a young man warm with every notion . . . connected with the sound of liberty, and by an *eccentricity* which such dispositions do not easily avoid, a lover of contradiction, and no friend to anything established.
Johnson, Akenside.

5. An eccentric action or characteristic; a striking peculiarity of character or conduct.

Whose [Frederic William's] *eccentricities* were such as had never before been seen out of a mad-house.
Macaulay, Frederic the Great.

Also *excentricity* in the literal uses.

Angle of eccentricity, in *geom.*, the angle whose sine is equal to the eccentricity of an ellipse.—**Bisection of the eccentricity.** See *bisection.*—**Temporal eccentricity,** in *anc. astron.*, the eccentricity of the orbit of Mercury at any time. Since the eccentric of Mercury was supposed itself to be carried on an eccentric, it follows that the eccentricity would not be a constant quantity.

ecchymosed (ek′i-mōst), *a.* [< *ecchymos-is* + *-ed*[2].] Characterized by or partaking of the nature of ecchymosis.

The changes which take place in the colour of an *ecchymosed* spot are worthy of attention, since they may serve to aid the witness in giving an opinion on the probable time at which a contusion has been inflicted.
A. S. Taylor, Med. Jurisprudence, p. 192.

ecchymosis (ek-i-mō′sis), *n.*; pl. *ecchymoses* (-sēz). Ecclesiastical books, in the *early church*, books allowed to be read in church, especially those read for edification and for the instruction of catechumens, but not belonging in the strictest sense to the canon of Scripture. This name was applied to such books as those named in the sixth of the Thirty-nine Articles of the Church of England, after the canonical books of the Old Testament, as "the other books," and collected in the King James Bible under the heading "Apocrypha."—**Ecclesiastical calendar.** See *calendar.*—**Ecclesiastical colors.** See *color.*—**Ecclesiastical commission.** (*a*) A court appointed by Queen Elizabeth, and invested by her with nearly absolute powers, for the purpose of regulating religious opinions, and punishing all departure from the church standards either in doctrine or in ritual. It was subsequently abolished by Parliament. (*b*) A standing commission in England, created by Parliament in the early part of the nineteenth century, invested with important powers for the reform of the established church. Its plans have to be submitted, after due notice to persons interested, to the sovereign in council, and be ratified by orders in council; but after ratification and due publication they have the same effect as acts of Parliament.—**Ecclesiastical councils.** See *council*, 7.—**Ecclesiastical courts,** church courts in which the canon law is administered and ecclesiastical causes are tried. In countries in which the church is established by law the decisions of these courts have a binding legal effect, and the courts constitute a part of the judicial machinery of the community; in other countries their decisions are binding only within the church, and enforced only by church discipline. In England there are several ecclesiastical courts. That of primary resort is the Consistory Court of the diocese; from it appeals go to the Court of Arches, and from there to the Privy Council. In the Protestant Episcopal Church of America the administration of discipline of lay members is wholly in the hands of the rector, an appeal lying to the bishop. The method of proceeding against clergymen in each diocese is determined by diocesan canons. A bishop is tried by the House of Bishops. In the Presbyterian Church the ecclesiastical courts are the Session, Presbytery, Synod, and General Assembly, the last being the court of last resort; in the Methodist Church trials are had before a church committee, with an appeal to the Conference; in both churches there are provisions for the constitution of courts for the trial of clergymen for false doctrine or immoral conduct. In churches of the Congregational system there are no ecclesiastical courts; the local church is the only tribunal recognized. In the Roman Catholic Church there are bishops' courts for the trial of ordinary church causes, the trial of bishops being reserved to the pope; but the methods of procedure differ according to the position of the church in different countries.—**Ecclesiastical epistles,** in the *Rom. Cath. Ch.*, letters written by church dignitaries officially, and carrying with them ecclesiastical authority, as apostolic epistles written by the Roman pontiff in virtue of his apostolic authority, commendatory epistles (see *commendatory*), dimissory epistles (see *dimissory*), encyclical epistles (see *encyclic*), pastoral epistles, and epistles of instruction to particular churches.—**Ecclesiastical fast.** See *fast*[3].—**Ecclesiastical history,** the history of the church from the beginning to the present time, including both Old Testament and New Testament history; more specifically, the history of the Christian church, including both its interior and its exterior development—that is, its organization and also the development of its doctrinal beliefs.—**Ecclesiastical law,** the law of the church as administered in the ecclesiastical courts; in a more general sense, especially in those countries where there is no church establishment, the whole body of the law relating to religion or religious institutions as administered in the civil courts.—**Ecclesiastical mode.** See *mode.*—**Ecclesiastical moon,** or *calendar moon*, a fictitious month used in determining the date of Easter. It is made purposely to depart from the natural month, to avoid the possibility of a coincidence of Easter with the Jewish Passover.—**Ecclesiastical notary.** See *notary.*—**Ecclesiastical polity,** the principles and laws of church government.—**Ecclesiastical state**†, the body of the clergy.

A normal dorsal is developed on the hinder part of the body, and the anal nearly corresponds to it. The ventrals are thoracic in position, and have 5 rays, and a slender spine closely attached to the adjoining ray. By means of the disk, acting as a sucker, these fishes attach themselves to other animals. They are known to sailors and fishermen as *suckers* or *sucking-fishes.* About a dozen species are known; the most common are *Echeneis naucrates* and *Remora remora.* Also *Echenidæ, Echeneidini.* See *pilot-fish, remora.*

II. *n.* Any one of the *Echinodermata*.

All *echinoderms* have a calcareous skeleton, and many are provided with movable spines. A characteristic apparatus of vessels, termed the ambulacral or water-vascular system, is present. It is composed of a ring round the pharnyx, from which proceed a number of radiating canals, commonly giving off cæcal appendages (Polian vesicles), as well as branches which enter the retractile tube-feet, often furnished with a terminal disk or sucker, which with the spines are the organs of locomotion. Echinodermata (e-kī-nō-dėr'mą-tą), *n. pl.* [NL., neut. pl. of *echinodermatus*: see *echinodermatous*.] A phylum or subkingdom of metazoic animals; the echinoderms. They represent one of the most distinct types of the animal kingdom, agreeing with cœlenterates in having a radiate or actinomeric arrangement of parts, usually pentamerous or by fives or tens, a digestive canal, a water-vascular or ambulacral apparatus, a true blood-vascular system, and the integument indurated by calcareous deposits, as either granules, spicules, or hard plates forming a shell. The alimentary canal is distinct from the general body-cavity; there is a deuterostomatous oral orifice or mouth, and usually an anus. The sexes are mostly distinct. The species undergo metamorphosis; the free-swimming ciliated embryo is known as a pluteus, in some cases as an echinopædium (see cut under *echinopædium*); the adult form is usually assumed by a complicated kind of secondary development from the larval form, which is mostly bilateral. The *Echinodermata* were so named by Klein in 1734, and in Cuvier's system were the first class of his *Radiata*; they are still sometimes reduced to a class with the *Cœlenterata*. As a subkingdom they are divisible into four classes: *Crinoidea*, *Echinoidea*, *Asteroidea*, and *Holothurioidea*, or the crinoids, sea-urchins, starfishes, and sea-cucumbers. As a class they are sometimes divided directly into seven orders: *Echinoidea* (sea-urchins), *Asteroidea* (starfishes), *Ophiuroidea* (sand-stars and brittle-stars), *Crinoidea* (feather-stars), *Cystoidea* (extinct), *Blastoidea* (extinct), and *Holothurioidea* (sea-cucumbers). All are marine. Also *Echinoderma*.

The organization of the *Echinodermata* does in fact appear so different from that of the cœlenterates, and seems to belong to a so much higher grade of development, that the combination of the two groups as Radiata is inadmissible, and so much the more so since the radial arrangement of the structure exhibits some transitions towards a bilateral symmetry. The *Echinodermata* are separated from the Cœlenterata by the possession of a separate alimentary canal and vascular system, and also by a number of peculiar features both of organization and of development. *Claus*, Zoölogy (trans.), I. 267.

echinodermatous (e-kī-nō-dėr'mą-tus), *a.* [⟨ NL. *echinodermatus*, ⟨ Gr. *ἐχῖνος*, a hedgehog, sea-urchin, + *δέρμα*(*τ*-), skin.] Having a spiculate or indurated skin; specifically, of or pertaining to the echinoderms or *Echinodermata*. Also *echinodermal*.

In E. R. Lankester's arrangement of *Mollusca*, the *Echinoglossa* are divided into three classes: *Gastropoda*, *Cephalopoda* (including *Pteropoda*), and *Scaphopoda*. *Odontophora* is a synonym.

echinoglossal (e-kī-nō-glos'al), *a.* and *n.* [⟨ *Echinoglossa* + *-al*.] **I.** *a.* Pertaining to or having the characters of the *Echinoglossa*.

II. *n.* A member of the *Echinoglossa*.

Having the form or appearance of a sea-urchin: in entomology, applied to certain insect-eggs which are shaped like an echinus, and covered with crowded deep pits.—2. Pertaining to the *Echinoidea*.

II. *n.* In *zoöl.*, one of the *Echinoidea*.

The spheroidal *echinoids*, in reality, depart further from the general plan and from the embryonic form than the elongated spatangoids do. *Huxley*, Lay Sermons, p. 223.

Echinoidea (ek-i-noi'dē-ą), *n. pl.* [NL., ⟨ *Echinus* + *-oidea*.] A class of the phylum or subkingdom *Echinodermata*; the sea-urchins or sea-eggs. They have a rounded, depressed (not elongated) form, subspherical, cordiform, or discoid, inclosed in a test or shell composed of many calcareous plates closely and usually immovably connected, studded with tubercles and bearing movable spines, and perforated in some places for the emission of tube-feet; an oral and anal orifice always present, a convoluted intestine, a water-vascular system, a blood-vascular system, and sometimes respiratory as well as ambulatory appendages. The perforated plates are the ambulacra, alternating with imperforate interambulacral plates; there are usually five pairs of each. The anus is dorsal or superior, the mouth ventral or inferior; the latter in many forms has a complicated internal skeleton. The general arrangement of parts is radiate or actinomeric, with meridional divisions of parts; but bilaterality is recognizable in many adults, and perfectly expressed in the larval forms. The *Echinoidea* are divisible into *Regularia*, *Desmosticha*, or *Endocyclica*, containing the ordinary symmetrically globose forms, as *Cidaris*, *Echinus*, and *Echinometra*; and the *Irregularia*, *Petalosticha*, or *Exocyclica*, containing the cake-urchins and heart-urchins, or the clypeastroids and spatangoids (respectively sometimes erected into the orders *Clypeastrida* and *Spatangida*); together with the Paleozoic echinoids, which in some systems constitute a third order, *Palæchinoidea*. Also *Echinoida*.

Diagram of Echinopædia, much enlarged.

A, common primitive form of *Echinodermata*, whence *B*, *B′*, a vermiform holothurid, and *C*, *C′*, a pluteiform ophiurid or echinid (pluteus) larva are derived: *a*, mouth; *b*, stomach; *c*, intestine; *d*, anus; *e*, ciliated band.

given by Huxley to the primitive generalized type-form of the *Echinodermata*, illustrated by the bilaterally symmetrical embryonic stage of nearly all members of that class. See the extract.

In many Echinoderms, the radial symmetry, even in the adult, is more apparent than real, inasmuch as a median plane can be found, the parts on each side of which are disposed symmetrically in relation to that plane. With a few exceptions, the embryo leaves the egg as a bilaterally symmetrical larva, provided with ciliated bands, and otherwise similar to a worm-larva, which may be termed an *Echinopædium*. The conversion of the *Echinopædium* into an Echinoderm is effected by the development of an enterocœle, and its conversion into the peritoneal cavity and the ambulacral system of veins and nerves, and by the metamorphosis of the mesoderm into radially-disposed antimeres, the result of which is the more or less complete obliteration of the primitive bilateral symmetry of the animal.

Huxley, Anat. Invert., p. 466.

=Syn. *Echinopædium*, *Pluteus*. *Echinopædium* is the more general term, used by its proposer to cover any embryonic or larval stage of any echinoderm from the gastrula stage to the assumption of its specific characters. A *pluteus* is a special pluteiform larva of some echinoderms, as the holothurians, ophiurians, and echinids proper.

[L., < Gr. ἐχῖνος, the hedgehog, urchin, prop. ἐχῖνος χερσαῖος, land-urchin, as distinguished from ἐχῖνος πελάγιος, the sea-urchin; = Lith. *ezys* = OBulg. *jezĭ* = AS. *igil*, and contr. *īl* = D. *egel* = OHG. *igil*, MHG. G. *igel* = MLG. LG. *egel* = Icel. *īgull*, a hedgehog.] 1. A hedgehog.—2. A sea-urchin.—3. [*cap.*] [NL.] A Linnean genus (1735), formerly used with great latitude, now the typical genus of the family *Echinidæ*, containing such sea-urchins or sea-eggs as *E. sphæra*, the common British species, or the Mediterranean *E. esculentus*, which is extensively used for food, the ovaries being eaten. The genus may be taken to exemplify not only the family to which it pertains, but the whole order of regular sea-eggs, and the class of sea-urchins itself. The shape is depressed-globose, with centric mouth and anus; the shell or test is hard, immovable, meridionally divided into five pairs of imperforate alternating with five pairs of perforate plates, the plates studded with tubercles, and in life bearing movable spines. The perforate plates are the ambulacra, emitting the tube-feet. The mouth has a complicated system of plates, constituting the object known, when detached, as *Aristotle's lantern* (which see, under *lantern*). A sea-urchin is comparable to a starfish with the five arms bent upward and their ends brought together in the center over the back of the animal, and then soldered together throughout, with the modification of internal structure which such an arrangement of the parts would necessarily entail.

Sea-urchin (*Echinus esculentus*).

corresponding feature in capitals of other orders, or any molding of similar profile to the Doric echinus. Such moldings are often sculptured or painted with the egg-and-dart ornament.

In this instance the abacus is separated from the shaft; there is a bold *echinus* and a beaded necking; in fact, all the members of the Grecian order, only wanting the elegance which the Greeks added to it.

J. Fergusson, Hist. Arch., I. 342, note.

échiqueté (ā-shē-kè-tā′), *a.* [F., formerly *eschiqueté*, formed (with prefix *es-*, *é-* (< L. *ex-*), out, off, instead of *des-*, *de-*, *dé-* (< L. *de-*), of, off) from *déchiqueté*, pp. of *déchiqueter*, divide into checks, under influence of *échiquier*, a checkerboard: see *check*[1]. Large pods, plumose seeds, and narrow, linear leaves have been found associated. The fruits have been compared with the boraginaceous genus *Echites*, and the seeds resemble the achenia and pappus of the *Cichoriaceæ*. These forms occur chiefly in the Miocene of Europe.

Echium (ek'i-um), *n.* [NL., < Gr. ἔχιον, a plant (*Echium rubrum*), < ἔχις, a viper: see *Echis*.] A genus of boraginaceous plants, tall hairy herbs or somewhat shrubby, natives of the old world. The group contains the families *Echiuridæ* and *Sternaspidæ*, and is equivalent to a gephyrean order *Chætifera*.

The *Echiuroidea* or chætiferous gephyrea present no external segmentation of their elongated and contractile body; they have, however, in the young state, the rudiments of 15 metameres. *Claus*, Zoölogy (trans.), I. 389.

Echiurus (ek-i-ū'rus), *n.* [NL. (for **Echidurus*), < Gr. ἔχις (ἐχιδ-), an adder, viper, + οὐρά, a tail.] A genus of chætophorous gephyreans (one of the group *Chætiferi* of Gegenbaur), armed with two strong setæ on the ventral side (whence the name). The cuticle develops chitinous processes, and there is a communication between the rectum and the perivisceral cavity by means of a pair of tubular organs which are ciliated internally and at their apertures. It is the typical genus of the family *Echiuridæ*. *E. pallasi* of the North Sea is an example. Also written *Echiuris*.

echlorophyllose (ē-klō-rō-fil'ōs), *a.* [< NL. **echlorophyllosus*, < L. *e-* priv. + *chlorophyllum*, chlorophyl: see *chlorophyl*, *chlorophyllous*.] ★Without chlorophyl. *Braithwaite*.

echo (ek'ō), *n.*; pl. *echoes* (-ōz). [Altered (after L.) from earlier spelling; early mod. E. also *echoe*, *eccho*; < ME. *ecco*, *ekko* = D. G. *echo* = Dan. *echo*, *ekko* = Sw. *eko* = OF. *eqo*, F. *écho* = Sp. *eco* = Pg. *ecco*, *echo* = It. *eco*, < L. *echo* (ML. also *ecco*), < Gr. ἠχώ, a sound, an echo; cf. ἦχος, ἠχή, a sound, noise, ἠχεῖν, sound, ring, etc.] **1.** A sound repeated by reflection from some obstructing surface so that a person in the path of both the original and the reflected waves will hear the sound twice. Sound being produced by waves of the air, when such waves meet an opposing surface, as a wall, they are reflected like light-waves (see *reflection*); the sound so heard, as if originating behind the reflecting surface, is an echo. The echo of a sound returns to the point whence the sound originated if the reflecting surface is at right angles to a line drawn to it from that point. An oblique surface reflects the sound in another direction, so that it may be heard elsewhere, though not at the point where the sound originated. If the direct and reflected sounds succeed one another with great rapidity, which happens when the reflecting surface is near, the echo only clouds the original sound, but is not heard distinctly; and it is such indistinct echoes that interfere with the hearing in churches and other large buildings. An interval of about one ninth of a second is necessary to discriminate two successive sounds; and as sound passes through the atmosphere at the rate of about 1,125 feet in a second, $\frac{1}{18}$ of 1,125, or about 62 feet, will be the least distance at which an echo can be heard; and this will be distinct only in the case of a sharp, sudden sound. The walls of a house or the ramparts of a city, the surface of a cloud, a wood, rocks, mountains, and valleys produce echoes. Some echoes are remarkable for their frequency of repetition, and are called *multiple* or *tautological echoes*.

Folweth *Ekko*, that holdeth no silence,
But ever answereth at the countretaille.
Chaucer, Clerk's Tale, l. 1132.

The babbling *echo* mocks the hounds,
Replying shrilly to the well-tun'd horns,
As if a double hunt were heard at once.
Shak., Tit. And., ii. 3.

The Scriptures are God's voice; the church is his *echo*, a redoubling, a repeating of some particular syllables and accents of the same voice. *Donne*, Sermons, xiv.

Blow, bugle, blow, set the wild *echoes* flying,
And answer, *echoes*, answer, dying, dying, dying.
Tennyson, Princess, iii. (song).

2. [*cap.*] In *classical myth.*, an oread or mountain nymph, who, according to a usual form of the myth, pined away for love of the beautiful youth Narcissus till nothing remained of her but her voice.

Within thy aery shell. *Milton*, Comus, l. 230.

3. Figuratively, a repetition of the sentiments of others; reproduction of the ideas or opinions of others, either in speech or in writing.

It is the folly of too many to mistake the *echo* of a London coffeehouse for the voice of the kingdom.
Swift, Conduct of the Allies.

4. In *music*, the very soft repetition of a short phrase, particularly in orchestral or organ music. In large organs an echo-organ is sometimes provided for echo-like effects; it consists of pipes shut up in a tight box, or removed to a distance from the organ proper, and controlled by a separate keyboard or by separate stops. A single stop so used or placed is called an *echo-stop*.

5. In *arch.*, a wall or vault, etc., having the property of reflecting sounds or of producing an echo. —**6.** [*cap.*] [NL.] In *zoöl.*, a genus of neuropterous insects. *Selys*, 1853.—**7.** In *whist-playing*, a response to a partner's signal for trumps.—**To the echo**, so as to produce a reverberation of sound; hence, loudly; vehemently; so as to excite attention and response: chiefly used with *applaud* or similar words.

I would *applaud* thee *to the* very *echo*,
That would applaud again.
Shak., Macbeth, v. 3.

★**echo** (ek'ō), *v.* [< *echo*, *n.*] **I.** *intrans.* **1.** To emit an echo; reflect or repeat sound; give forth an answering sound by or as if by echo.

And kiss'd her lips with such a clamorous smack,
That, at the parting, all the church did *echo*.

Celestial voices. *Milton*, P. L., iv. 681.

2. To be reflected or repeated by or as if by echo; return or be conveyed to the ear in repetition; pass along by reverberation.

Her mitred princes hear the *echoing* noise,
And, Albion, dread thy wrath and awful voice.
Sir R. Blackmore.

3. To produce a reverberating sound; give out a loud sound.

Drums and trumpets *echo* loudly,
Wave the crimson banners proudly.
Longfellow, The Black Knight (trans.).

II. *trans.* **1.** To emit an echo of; reflect the sound of, either directly or obliquely; cause to be heard by reverberation: as, the whispering gallery of St. Paul's in London *echoes* very faint sounds.

Never [more shall] the black and dripping precipices
Echo her stormy scream as she sails by.
M. Arnold, Sohrab and Rustum.

2. To repeat as if by way of echo; emit a reproduction of, as sounds, words, or sentiments; imitate the sound or significance of.

Then gan triumphant Trompets sownd on hye,
That sent to heven the *ecchoed* report
Of their new joy, and happie victory.
Spenser, F. Q., I. xii. 4.

Those peals are *echoed* by the Trojan throng.

The whole nation was *echoing* his verse, and crowded theatres were applauding his wit and humour.
I. D'Israeli, Calam. of Authors, I. 159.

They would have *echoed* the praises of the men whom they envied, and then have sent to the newspapers libels upon them. *Macaulay*.

3. To imitate as an echo; repeat or reproduce the sounds, utterances, or sentiments of: as, the mocking-bird *echoes* nearly all other creatures; to *echo* a popular author.

And the true art for . . . popular display is—to contrive the best forms for appearing to say something new, when in reality you are but *echoing* yourself.
De Quincey, Style, i.

Nomenclator.

echoism (ek'ō-izm), *n.* [< *echo* + *-ism*.] In *philol.*, the formation of words by the echoing or imitation of natural sounds, as those caused by the motion of objects, as *buzz*, *whizz*, or the characteristic cries of animals, as *cuckoo*, *chickadee*, *whip-poor-will*, etc.; onomatopœia. [Recent.]

Onomatopœia, in addition to its awkwardness, has neither associative nor etymological application to words imitating sounds. It means word-making or word-coining, and is as strictly applicable to Comte's *altruisme* as to *cuckoo*. *Echoism* suggests the echoing of a sound heard, and has the useful derivatives *echoist*, *echoize*, and *echoic*, instead of *onomatopoetic*, which is not only unmanageable, but, when applied to words like *cuckoo*, *crack*, erroneous; it is the voice of the cuckoo, the sharp sound of breaking, which is onomatopoetic or word-creating, not the echoic words which they create.
J. A. H. Murray, 9th Ann. Address to Philol. Soc.

echoist (ek'ō-ist), *n.* [< *echo* + *-ist*.] One who forms words by the imitation or echoing of sounds. See *echoism*. [Recent.]

foraging or *army ants*, usually placed in the family *Myrmicidæ*, as the petiole of the abdomen has two nodes. It is now supposed that the genus *Labidus*, of the family *Dorylidæ*, is represented exclusively by the males of *Eciton*, and the characters of both groups require revision. These ants are found in South and Central America, and 3 species of *Eciton* and 6 of *Labidus* are known in the United States, from Utah, New Mexico, California, and Texas. There are two kinds of neuters or workers, large-headed and small-headed, the former of which are called *soldiers*. They are carnivorous, march in vast numbers, and are very destructive.

Wycherley, Country Wife.

Next morning I breakfasted alone with Mr. W[alpole]; when we had all the *eclaircissement* I ever expected, and I left him far better satisfied than I had been hitherto.
Gray, Letters, I. 124.

II. *n.* One who, in whatever department of knowledge, not being convinced of the fundamental principles of any existing system, culls from the teachings of different schools such doctrines as seem to him probably true, conformable to good sense, wholesome in practice, or recommended by other secondary considerations; one who holds that opposing schools are right in their distinctive doctrines, wrong only in their opposition to one another. In philosophy the chief groups of eclectics have been—(1) those ancient writers, from the first century before Christ, who, like Cicero, influenced by Platonic skepticism, held a composite doctrine of ethics, logic, etc., aggregated of Platonist, Peripatetic, Stoic, and even Epicurean elements; (2) writers in the seventeenth century who, like Leibnitz, mingled Aristotelian and Cartesian principles; (3) writers in the eighteenth century who adopted in part the views of Leibnitz, in part those of Locke; (4) Schelling and others, who held beliefs derived from various idealistic, pantheistic, and mystical philosophers; (5) the school of Cousin, who took a mean position between a philosophy of experience and one of absolute reason.

Even the *eclectics*, who arose about the age of Augustus, . . . were . . . as slavish and dependent as any of their brethren, since they sought for truth not in nature, but in the several schools.
Hume, Rise of Arts and Sciences.

My notion of an *eclectic* is a man who, without foregone conclusions of any sort, deliberately surveys all accessible modes of thought, and chooses from each his own "hortus siccus" of definitive convictions.

Sensualism, idealism, skepticism, mysticism, are all partial and exclusive views of the elements of intelligence. But each is false only as it is incomplete. They are all true in what they affirm, all erroneous in what they deny. Though hitherto opposed, they are, consequently, not incapable of coalition; and, in fact, can only obtain their consummation in a powerful *eclecticism*—a system which shall comprehend them all.
Sir W. Hamilton, Edinburgh Rev., L. 201.

An eclipse of the sun is caused by the intervention of the moon between it and the earth, the sun's disk being thus partially or entirely hidden; an eclipse of the moon is occasioned by the earth passing between it and the sun, the earth's shadow obscuring the whole or part of its surface, but never entirely concealing it. The number of eclipses of the sun and moon cannot be fewer than two nor more than seven in one year, exclusive of penumbral eclipses of the moon. The most usual number is four, seven being very rare. Tennyson, Aylmer's Field.

2. A great circle drawn upon a terrestrial globe, tangent to the tropics. It is sometimes said to "mark the sun's annual path across the surface of the earth"; but since its plane is represented as fixed upon the earth, the rotation of the latter will give it a gyratory motion incompatible with its representing any celestial appearance. It may, however, prove convenient when a terrestrial globe is used instead of a celestial one.

eclog, *n.* An abbreviated spelling of *eclogue*.

eclogite (ek′lō-jīt), *n.* [< Gr. ἐκλογος, picked out (< ἐκλέγειν, pick out, choose), + *-ite*[2].] The name given by Haüy to a rock consisting of a crystalline-granular aggregate of omphacite (a granular, grass-green variety of pyroxene) with red garnet. With these essential constituents cyanite (disthene) is often associated, and, less commonly, silvery mica, quartz, and pyrites. This is one of the most beautiful of rocks, and of rather rare occurrence. It is found in the Alps, in the Fichtelgebirge in Bavaria, in the Erzgebirge in Bohemia, and also in Norway. As a rule the colonies [of polyzoans] possess a horny or parchment-like, frequently also calcareous, exoskeleton, which arises from the hardening of the cuticle around the individual zoöids. Each zoöid is accordingly surrounded by a very regular and symmetrical case — the *ectocyst* or cell; through the opening of which the anterior part of the soft body of the contained zoöid with its tentacular crown can be protruded. *Claus*, Zoölogy (trans.), II. 71.

ectoderm (ek'tō-dėrm), *n.* [< Gr. *ἐκτός*, outside, + *δέρμα*, skin: see *derm*.] The completed outer layer of cells, or outer blastodermic membrane, in all metazoan animals, formed by the cells of the epiblast, and primitively constituting the outer wall of the whole body, as the endoderm does that of the body-cavity; an epiblast, ectoblast, or external blastoderm. The term is chiefly used in embryology, or of certain lower animals whose bodies consist essentially of an outer and an inner layer, and not as a synonym of the epidermis or cuticle of the higher animals. See cut under *gastrula*.

ectolecithal (ek-tō-les′i-thal), *a.* [‹ Gr. ἐκτός, outside, + λέκιθος, yolk, + *-al*.] In *embryol.*, noting those ova which have the food-yolk peripheral in position, and thus exterior to the formative yolk. The cleavage or segmentation is consequently confined at first to the inner parts of the ovum, and it is only in later stages, when the food-yolk has shifted to the center, that the cleavage becomes peripheral. The egg of the spider is an example. See *centrolecithal, telolecithal*.

The first processes of segmentation in these at first *ectolecithal* ova are withdrawn from observation, since they take place in the centre of an egg covered by a superficial layer of food-yelk. *Claus*, Zoölogy (trans.), I. 112.

In the *Ectoprocta*, . . . the endocyst consists of two layers, an outer and inner; of which the former is the representative of the ectoderm in other animals. The latter lines the walls of the perivisceral cavity, and is reflected thence, like a peritoneal tunic, over the tentacular sheath and into the interior of the tentacula, whence it is continued on to the alimentary canal, of which it forms the external investment. The endoderm, which lines the alimentary canal, is of course continuous, through the oral opening, with the ectoderm.

Either suffix is attached (with suppression of final silent *-e*, if any) to the infinitive or first person indicative, and varies in pronunciation and spelling according to the preceding consonant (the final consonant of the infinitive): (1) *-ed*, pronounced -ed after *t*, *d*, as in *heated*, *loaded*, etc., and archaically in other positions, as in *hallowed*, *raised*, etc., and usually in some perfect participles used adjectively, as in *blessed*, *crooked*, *winged*, etc., parallel to *blest*, *crooked* (pronounced krŭkt), *winged* (pronounced wingd), etc. (2) *-ed*, pronounced (with suppression of the vowel) d, after a sonant, namely, *b*, *g* "hard," *g* "soft" (*-ge* = *dzh* or *zh*), *j* (written *-ge*, as preceding), *s* (*-se* = *z*), *th* (= *dh*), *v*, *z*, *l*, *m*, *n*, *ng*, *r*, as in *robed*, *robbed*, *lagged*, *raged*, *engaged*, *rouged*, *hedged*, *raised*, *posed*, *smoothed*, *breathed*, *lived*, *buzzed*, *boiled*, *felled*, *beamed*, *dreamed*, *stoned*, *leaned*, *hanged*, *barred*, *abhorred*, etc. (but after the liquids *l*, *m*, *n*, *r*, in some words also or only *-t*: see below), or after a vowel, or a vowel before *h* or *w*, as in *hoed*, *rued*, *brayed*, *towed*, *awed*, *hurrahed*, etc.— most words of this class being formerly written without the vowel, which subsequently came to be indicated, pedantically, by an apostrophe, as in *rais'd*, *breath'd*, *liv'd*, etc. (this device being still retained by some, for its apparent metrical value, in verse, but otherwise little used in verbs, though it is the rule in the analogous instance of the possessive case of nouns, as in *man's*, *boy's*, etc.), except in a few words which have preserved the simple form, namely, (3) *-d*, pronounced d (the vowel being suppressed in both pronunciation and spelling), as in *laid*, *paid*, *staid*, *shod*, *heard*, *sold*, *told*, and (with loss of the final consonant of the infinitive) *clad*, *had*, and *made* (so spelled to preserve the "long" vowel), and, in preterit only, *could*, *should*, *would*— these forms being "irregular" in spelling only (*laid*, *paid*, *staid*), or in spelling and pronunciation, as compared with the forms having the usual

-ed. (4) *-ed*, pronounced t (the vowel being suppressed and the *d* assimilated to the preceding consonant) after a surd, namely, *c* "soft" (= *s*), *ch* (= *tsh*), *f*, *k*, *p*, *qu* (= *k*), *s* surd, *sh*, *th* surd, *x* (= *ks*), as in *faced, enticed, matched, cuffed, coughed* (pronounced kôft), *looked, lacked, tipped, piqued, pressed, classed, clashed, toothed, earthed, mixed*, etc., such words being formerly, as a rule, and still optionally (in verse, as preferred by Tennyson and other modern poets, or in restored or reformed spelling), spelled as pronounced, with *t*, as *lookt, lackt, tipt, prest, mixt, fixt*, etc.; in some words, where *-ed* after a liquid, *l*, *m*, *n*, *r*, or a vowel, is pronounced t instead of, as regularly, d, and in some words after *p*, the spelling *-t* prevails, either exclusively (and then accompanied by a change of the radical vowel), as in *dealt, felt, bought, caught, thought, wrought, brought, sought, taught, slept, swept, wept*, etc., or with a parallel form in *-ed* pronounced d, as in *spelt, spilt, spoilt, dreamt, leant, pent, burnt*, etc. (the *t* in some cases absorbing the final *-d* of the infinitive, as in *bent, blent, built, girt*, etc.), with parallel forms *spelled, spilled*, etc. (*bended, girded*, etc.). (5) In some monosyllables the suffix *-ed*, reduced to *-d* or *-t*, as above, has blended with the final *-d* or *-t* of the infinitive, forming, in earlier spelling, a double consonant, *dd* or *tt*, which has since been simplified, as in *shed, shred, hit, split*, etc., all trace of the suffix being thus effaced, and such preterits and past participles being assimilated to the infinitive; an original long vowel in the infinitive becoming short in the preterit and past participle, as in *read*, preterit and past participle *read* (red), *lead*, preterit and past participle *led* (where the change is recognized in the spelling), and hence, rarely, in the infinitive, as in *spread*, preterit and past participle *spread*. Some words ending in *-ed*[2] (participles used as adjectives) may, with the definite article, or other definitive word, preceding, come to be used as nouns, having as such a possessive case (in *'s*) and a plural (in *-s*): as, the police took charge of *the deceased's* effects; at this *the accused's* countenance changed. This is found chiefly in newspaper language; but the plural, as "*their beloveds*," is not uncommon in recent poetry. See *-d*[1], *-d*[2], *-t*[1], *-t*[2].

Edda (ed'ä), *n.* [Prob. < ON. *odhr*, poetry.] A book written (in prose) by Snorri Sturluson (born about 1178, died by assassination 1241), containing the old mythological lore of Scandinavia and the old artificial rules for verse-making; also, a collection of ancient Icelandic poems. The name *Edda*, by whom given is not known, occurs for the first time in the inscription to one of the manuscripts of the work, written fifty or sixty years after Snorri's death. Snorri's Edda (*Edda Snorra Sturlusonar*) consists of five parts: *Formáli* (Preface), the *Gylfaginning* (Delusion of Gylfi), *Braga-radhur* (Sayings of Bragi), *Skáldskapar-mál* (Art of Poetry), and *Háttatal* (Number of Meters), to which are added in some manuscripts *Thulur*, or a rhymed glossary of synonyms, lists of poets, etc. As the *Skáldskapar-mál*, or Art of Poetry, forms the chief part of the Edda (including several long poems), the work became a sort of handbook of poets, and so *Edda* came gradually to mean the old artificial poetry as opposed to the modern plain poetry contained in hymns and sacred poems. About the year 1643 the Icelandic bishop Brynjulf Sveinsson discovered a collection of the old mythological poems, which is erroneously ascribed to Sæmund Sigfussen (born about 1055, died 1133), and hence called after him *Sæmundar Edda hins Frōdha*, the Edda of Sæmund the Learned. The poems that compose this Edda are supposed to have been collected about the middle of the thirteenth century, but were composed probably in the eighth and ninth centuries. Hence the name now given to the collection, the *Elder* or *Poetic Edda*, in distinction from the *Younger* or *Prose Edda* of Snorri, to which alone the name *Edda* previously belonged. The most ancient of the poems in the Elder Edda is the *Völuspa*, the Prophecy of the *Völva* or sibyl.

Eddies are due to the viscosity of fluids, and to the very small degree to which they slip over the surfaces of solids. They are always found between counter-currents.

Edentata (ē-den-tā′tă), *n. pl.* [NL., neut. pl. of L. *edentatus*, toothless: see *edentate.*] 1. In *mammal.*, a Cuvierian order of mammals; the edentates. The term is literally incorrect, and in so far objectionable, few of these animals being edentulous or toothless; and the Linnean equivalent term, *Bruta*, is often employed instead. But the name is firmly established, and the members of the order do agree in certain dental characters, which are these: that incisors are never present, and that the teeth, when there are any, are homodont and (excepting in *Tatusiinæ*) monophyodont, growing from persistent pulps, and being devoid of enamel.

Edentate Skull of Great Ant-eater (*Myrmecophaga jubata*).

The *Edentata* are ineducabilian placental mammals, with a relatively small cerebrum of one lobe, but otherwise very diversiform in structure, appearance, and mode of life; the old-world forms are likewise widely different from those of the new world; most edentates are of the latter. The armadillos, sloths, and ant-eaters of America, and the fodient ant-eaters and scaly ant-eaters of Africa and Asia, represent respectively five leading types of *Edentata*, affording a division of the order into the five suborders *Loricata* (armadillos), *Tardigrada* (sloths), *Vermilinguia* (American ant-eaters), *Squamata* (scaly ant-eaters or pangolins), and *Fodientia* (digging ant-eaters or aardvarks). The tardigrades, including a number of gigantic fossil forms, as the mylodons and megatheriums, formerly called *Gravigrada*, are herbivorous, and the living forms are all arboricole. The others are carnivorous and chiefly insectivorous, and it is among these that the entirely toothless forms occur, as in the ant-eaters. The Cuvierian *Edentata* included the *Monotremata*, now long since eliminated.

ee. A common English digraph, of Middle English origin, having now the sound of "long" *e*, namely, ē. In Middle English it was actually "double" *e*—that is, the long sound ā corresponding to the short sound e, representing an Anglo-Saxon long *e* (*ē*), as in *beet*, *greet*, *meet*, *breed*, *feed*, etc., or an Anglo-Saxon *æ*, as in *seed*, *eel*, *sleep*, *weed*[2], etc., or *eá*, as in *cheek*, *steep*, *leek*, etc., or *eó*, as in *bee*, *deer*, *deep*, *creep*, *weed*[1], etc., such vowels or diphthongs becoming in later Middle English long *e*, written either *e* or *ee*, and in early modern English spelled *ee* or *ea*, with some differentiation (see *ea*). In words of other than Anglo-Saxon origin *ee* has the same sound, except in a few words not completely Anglicized, as in *matinée*. Words of Oriental or other remote origin having the vowel *i* (pronounced ē) are often spelled with *ee* when ★turned into English form, as *elchee*, *suttee*, etc.

E. E. An abbreviation of *errors excepted*, a saving clause frequently placed at the foot of an account rendered. Also, in a fuller form, *E. and O. E.* (which see).

-ee[1]. [Late ME. *-e* or *-ee*, < OF. *-e*, fem. *-ee*, mod. F. (with a diacritical accent) *-é*, fem. *-ée* (pron. alike), < L. *-atus*, fem. *-ata*, pp. of verbs in *-are*, F. *-er*. Early ME. *-e*, *-ee*, from the same source, has usually become thoroughly Englished as *-y*, or *-ey*; cf. *arm-y*, *jur-y*, *jell-y*, *chimn-ey*, *journ-ey*, etc. See *-ate*[1], *-ade*[1], *-y*.] A suffix of French, or more remotely of Latin origin, ultimately the same as *-ate*[1] and *-ed*[2], forming the termination of the perfect passive participle, and indicating the object of an action. It occurs chiefly in words derived from old Law French or formed according to the analogy of such words, as in *pay-ee*, *draw-ee*, *assign-ee*, *employ-ee*, etc., denoting the person who is paid, drawn on, assigned to, employed, etc., as opposed to the agent in *-or*[1] or *-er*[1] (in legal use generally *-or*[1]), as *pay-er* or *pay-or*, *draw-er*, *assign-or*, *employ-er*, etc.

-ee[2]. [Cf. dim. *-ie*, *-y*, and see *-ee*[1].] A diminutive termination, occurring in *bootee*, *goatee*, etc. The diminutive force is less obvious in *settee*, which may be regarded as a diminutive of *sett-le*.

The body is very long and subcylindrical, covered with discrete minute elliptical scales, chiefly arranged diagonally to the axis and at right angles with one another, but immersed in the skin, and partly concealed by a slippery mucous coat. The head is somewhat depressed, and the lower jaw protuberant. The teeth are slender, conic, and crowded in small bands in both jaws and in a longitudinal band on the vomer. The dorsal, anal, and caudal fins are nearly uniform, and completely united into one, the dorsal beginning near the second third of the entire length of the body. The color is generally brownish or blackish, except on the belly, which is whitish or silvery. The females attain a considerably larger size than the males. The sexual organs are minute except in the breeding season, and sexual intercourse takes place in the sea. Young females ascend into fresh water, but the males remain in salt water, and have rarely been seen; and when full-grown the females return to the sea for sexual intercourse and spawning. Eels are of much economic importance, and objects of special fisheries. The common European species is *Anguilla anguilla* or *A. vulgaris*; the American is *A. rostrata*. See *Anguilla*, *Anguillidæ*.

It has the power of giving strong electric discharges at will. The shocks produced are often violent, and serve as a means both of offense and of defense. They are weakened by frequent repetitions. Its electrical apparatus consists of two pairs of longitudinal bodies between the skin and the muscles of the caudal region, one pair next to the back and one along the anal fin. This apparatus is divided into about 240 cells, and is supplied by over 200 nerves. The electric eel is the most powerful of electric fishes. It sometimes attains a length of over 6 feet. It inhabits the fresh waters of Brazil and Guiana.—**Pug-nosed eel**, an eel of the genus *Simenchelys* (which see): so called by fishermen. It is a deep-sea species, found off the Newfoundland banks, often burrowing in the halibut, whence the specific name *S. parasiticus*.—**Salt eel.** (*a*) An eel or an eel's skin prepared for use as a whip.

These baskets are usually attached to a framework of wood erected in a river, especially a tideway river, the large open end of each being opposed to the current of the stream. The conception of *efficient cause* antedates that of physical force in the scientific sense; and the latter finds no place in the Aristotelian division of causes. But many writers of the eighteenth and nineteenth centuries extend the meaning of *efficient cause* to include forces. Other and inferior writers, since the Aristotelian philosophy has ceased to form an essential part of a liberal education, use the phrase *efficient cause* in imitation of older writers, but without any distinct apprehension of its meaning, probably in the sense of *effectual cause.* (See the citation from Lecky, below.) *Efficient causes* are traditionally divided into various classes: 1st, into *active* and *emanative:* thus, fire is said to be the emanative cause of its own heat and the active cause of heat in other bodies; 2d, into *immanent* and *transient:* an immanent cause brings about some modification of itself (it is, nevertheless, regarded as external, because it does not produce itself); 3d, into *free* and *necessary;* 4th, into *cause by itself* and *cause by accident:* thus, if a man in digging a well finds a treasure, he is the cause per se of the well being dug, and the cause by accident of the discovery of the treasure; 5th, into *absolute* and *adjuvant*, the latter being again divided into *principal* and *secondary*, and *secondary* into *procatarctical*, *proegumenal*, and *instrumental* (the procatarctical extrinsically excites the principal cause to action, the proegumenal internally disposes the principal cause to action); 6th, into *first* and *second;* 7th, into *universal* and *particular;* 8th, into *proximate* and *remote.* Medical men follow Galen in dividing the efficient causes of disease into *predisposing*, *exciting*, and *determining.*

Every politician knew that the interference of the sovereign during the debate in the House of Lords was the *efficient cause* of the change of ministry. *Lecky*, Eng. in 18th Cent., xv.

In his experiments to determine the rate of effusion of gases, Graham used thin sheets of metal or glass, perforated with minute apertures .086 millimeter or .003 inch in diameter. Pol. *jaje* = Bohem. *vejce* = Russ. (dim.) *yaitse*, an egg. The orig. form of the word is uncertain; not found in Skt., etc.] **1.** The body formed in the females of all animals (with the exception of a few of the lowest type, which are reproduced by gemmation or division), in which, by impregnation, the development of the fetus takes place; an ovum, ovule, or egg-cell; the procreative product of the female, corresponding to the sperm, sperm-cell, or spermatozoön of the male. In biology the term is used in the widest possible sense, synonymously with *ovum* (which see). In its simplest expression, an egg is a mass or speck of protoplasm capable of producing an organism like the parent, sometimes by itself, oftener only by impregnation with the corresponding substance of the opposite sex; and in low sexless organisms the generative body is indistinguishable as an egg-cell from a sperm-cell. In higher animals which have opposite sexes the egg is usually distinguished from the spermatozoön by its greater relative size and its sphericity. Regarded morphologically, an egg has throughout the animal kingdom one single and simple character, or morphic valence, that of the cell, in which a cell-wall, cell-substance, a nucleus, and a nucleolus are, as a rule, distinguishable. Such an egg is usually of microscopic or minute size; and, however comparatively enormous an egg may become by the addition of other structures, its morphological character as a cell is not altered. Thus, an egg, in its primitive undifferentiated and unimpregnated condition, does not differ morphologically from any other cell of an animal organism, or from the whole of a single-celled animal, nor can the egg of a sponge, for example, be distinguished from that of a woman. Physiologically, however, the egg differs enormously from other cells, in that under proper conditions it may germinate or build up an entire organism like that of the parent. This is usually possible only after impregnation; but the eggs of parthenogenetic insects, as aphids, germinate for several generations without the male element. The parts of an egg may be named in general terms, the same as those used for other cells; but special names are usually applied. Thus, the nucleolus or smallest and inmost recognizable constituent is called the *germinal spot* or *spot of Wagner;* the nucleus is called the *germinal vesicle* or *vesicle of Purkinje* (in both cases wrongly, because these parts are not specially concerned in germination, and may even disappear after impregnation, the germinal vesicle proper being quite another structure). The common cell-substance or protoplasm is the *vitellus* or *yolk;* the cell-wall is the *vitelline membrane*, sometimes called in human anatomy the *zona pellucida*. To these regular constituents of an egg may be added others, namely: (1) a large, sometimes enormous, mass of granular colored albumen or food-yolk, as distinguished from the proper formative yolk, as that constituting nearly all the ball of yellow of a hen's egg; (2) a great quantity of colorless albumen, the "white" of an egg. Both the white and the "yellow," however large in mass, are included in what corresponds to the original cell-wall. But the latter may acquire with its great increase in size a special thickness and toughness, then becoming (3) the *egg-pod, putamen*, or *membrana putaminis;* which may be still further thickened and hardened, as (4) the *egg-shell*, either white or variously pigmented. Thus it is seen that the great size of some eggs, as those of all birds, most reptiles, many batrachians, and some fishes, is due to extraneous substances deposited upon the true egg or egg-cell. This process of inclusion may go still further, the egg, or a mass of eggs together, being enveloped in a glairy substance, *egg-glue* or *oöglœa*, as that of frogs' eggs, or encased in variously and often curiously constructed egg-cases. A trace of this is seen in the human egg, where a little granular matter, derived from a Graafian follicle and known as the *discus proligerus*, surrounds the egg-cell. Eggs the whole of whose yolk is formative, or makes up into the body of the embryo after segmentation of the whole vitellus, are called *holoblastic;* others, with a quantity of food-yolk which does not undergo segmentation, are *meroblastic*. All large eggs, as birds', are meroblastic. In these the egg proper is known as the *cicatricula* or *tread;* and the tough, stringy albumen which steadies or buoys the yellow in the white forms the *chalazæ*. The germ-yolk and the food-yolk may occupy different relative positions. (See *centrolecithal, ectolecithal*, etc.) The organ in which an egg is produced, whatever its size, shape, or position in the body of the female, is the *ovary;* the passage by which it is conveyed to another part of the body, or to the exterior, is an *oviduct*. In the former all the essential parts of the egg appear; in the latter various accessory structures, as the white and the shell, are deposited. All sexed animals "lay" eggs; those in which the egg passes directly out of the body, to be hatched outside, are called *oviparous;* those in which the egg severs its vascular or vital connection with the parent, but remains inside the body to hatch, are *ovoviviparous;* those whose eggs retain vascular connection with the parent, as by means of a placenta and an umbilical cord, so that they bring forth alive, are *viviparous*. In the last the oviducts are more or less modified, as into Fallopian tubes, uterus, and vagina, for the purpose of gestation, as distinguished from the incubation of eggs laid outside the body. Egg-laying, as of birds, reptiles, insects, etc., is called *oviposition;* many insects have the end of the abdomen modified into a special *ovipositor*. The normal and usual shape of an egg is the sphere, preserved even in some large eggs, as those of turtles; many eggs are cylindrical, with rounded ends; the largest eggs, with a hard chalky shell, as birds', present a characteristic figure, the *ovoid*, varying to more or less conical, or elliptical, or subspherical. In such cases the large end is called the *butt*, the small end the *point*. All mammalian eggs, excepting those of the oviparous monotremes, are spherical and microscopic; the egg of the human female measures about $\frac{1}{175}$ of an inch in diameter. A hen's egg of good size weighs about 1,000 grains, of which the white is 600, the yellow 300, the shell 100. An ostrich's egg holds about 3 pints. The largest known egg is that of the extinct Madagascan elephant-bird, *Æpyornis maximus*, having a capacity of about 12 dozen hens' eggs, and a long axis of a foot or more. Eggs of many animals besides birds are important food-products, of great economic and commercial value, as turtles' eggs, the roe of many fishes, the coral or berry of lobsters, etc.

ited upon and in among the fibers of the egg-pod or putamen. It is a secretion of a particular calcific tract of the oviduct near the end of that tube. It may be nearly colorless and of such crystalline purity and translucency that the contents of the fresh egg show a pinkish blush through it, or very heavy, opaque, flaky white; whole-colored of various tones, as green, blue, drab, ochrey, etc.; or party-colored in many shades of reds, browns, etc., in endless variety of patterns. Besides the evident diversity of character in thickness, roughness, etc., the shell has many variations in microscopic texture, depending upon details of the deposition of the particles of lime in the pod. The shell of an ostrich's egg is so thick and hard that it may seriously wound a man if the egg explodes, as it sometimes does when addled, in consequence of the compression of the gases generated in decomposition.—**Egg-shell china, egg-shell porcelain,** porcelain of extreme thinness and translucency. It was made originally in China, and is now produced also in European factories, where the process consists in filling a mold of plaster of Paris with the material called barbotine, of which a thin film at once adheres to the mold from the absorption of its moisture by the gypsum. The liquid barbotine being then thrown out and the mold put into the kiln, the film remaining in it is baked, and can then be removed from the mold.

The *ego*, as the subject of thought and knowledge, is now commonly styled by philosophers simply the subject, and subjective is a familiar expression for what pertains to the mind or thinking power. In contrast and correlation to these, the terms object and objective are now in use to denote the non-ego, its affections and properties, and, in general, the really existent as opposed to the ideally known. *Sir W. Hamilton.*

For the *ego* without the non-ego is impossible in fact and meaningless in thought, and the abstraction of the *ego* from the bodily organisation and the intuition of itself by itself as a non-bodily entity is an artificial and deceptive process. *Maudsley*, Body and Will, p. 55.

Absolute ego. See *absolute.*—**The empirical ego,** the self as the object of itself; what "I" am conscious of as "myself."—**The pure ego,** the self regarded abstractly as the mere thinking subject, apart from every object of thought, even itself.

ego-altruistic (ē′gō-al-trō̤-is′tik), *a.* Relating or pertaining to one's self and to others. See the extract.

From the egotistic sentiments we pass now to the *ego-altruistic* sentiments. By this name I mean sentiments which, while implying self-gratification, also imply gratification in others; the representation of this gratification in others being a source of pleasure not intrinsically, but because of ulterior benefits to self which experience associates with it. *H. Spencer*, Prin. of Psychol., § 519.

2. In *ethics*, the doing or seeking of that which affords pleasure or advantage to one's self, in distinction to that which affords pleasure or advantage to others: opposed to *altruism.* In this sense the term does not necessarily imply anything reprehensible, and is not synonymous with *egotism.*

Egoism is the feeling which demands for self an increase of enjoyment and diminution of discomfort. Altruism is that which demands these results for others.
L. F. Ward, Dynam. Sociol., I. 14.

Egoism comprises the sum of inclinations that aim at purely personal gratification, each of these inclinations having its particular gratification; and the further we go back in civilisation, the greater is the predominance which these egoistic impulses have.
Maudsley, Body and Will, p. 164.

3. In *metaph.*, the opinion that no matter exists and only one mind, that of the individual holding the opinion. This innocent imposture, which I have all along taken care to carry on, as it then was of some use, has since been of regular service to me, and, by being mentioned in one of my papers, effectually recovered my *egoity* out of the hands of some gentlemen who endeavoured to correct it for me. *Swift*, On Mirth's Tatler, No. 28.

If you would permit me to use a school term, I would say the *egoity* remains: that is, that by which I am the same I was. *W. Wollaston*, Religion of Nature, ix. § 8.

There can be no doubt that this remarkable man owed the vast influence which he exercised over his contemporaries at least as much to his gloomy *egotism* as to the real power of his poetry. *Macaulay*, Moore's Byron.

Selfishness is only active *egotism.*
Lowell, Among my Books, 1st ser., p. 364.

=**Syn.** *Pride, Egotism, Vanity, Conceit, Self-conceit, Self-consciousness.* *Pride* and *egotism* imply a certain indifference to the opinions of others concerning one's self. *Pride* is a self-contained satisfaction with the excellence of what one is or has, despising what others are or think. *Vanity* is just the opposite; it is the love of being even fulsomely admired. *Pride* rests often upon higher or intrinsic things: as, *pride* of family, place, or power; intellectual or spiritual *pride.* *Vanity* rests often upon lower and external things, as beauty, figure, dress, ornaments; but the essential difference is in the question of dependence upon others. Over the same things one person might have *pride* and another *vanity.* One may be too proud to be vain. *Conceit*, or *self-conceit*, is an overestimate of one's own abilities or accomplishments; it is too much an elevation of the real self to rest upon wealth, dress, or other external things. *Egotism* is a strong and obtrusive confidence in one's self, shown primarily in conversation, not only by frequent references to self, but by monopolizing

attention, ignoring the opinions of others, etc. It differs from *conceit* chiefly in its selfishness and unconsciousness of its appearance in the eyes of others. *Conceit* becomes *egotism* when it is selfish enough to disparage others for its own comparative elevation. *Self-consciousness* is often confounded with *egotism*, *conceit*, or *vanity*, but it may be only an embarrassing sense of one's own personality, an inability to refrain from thinking how one appears to others; it therefore often makes one shrink out of notice.

Vanity makes men ridiculous, *pride* odious. *Steele.*

Pride, indeed, pervaded the whole man, was written in the harsh, rigid lines of his face, was marked by the way in which he stood, and, above all, in which he bowed. *Macaulay*, William Pitt.

His excessive *egotism*, which filled all objects with himself. *Hazlitt.*

We never could very clearly understand how it is that *egotism*, so unpopular in conversation, should be so popular in writing. *Macaulay*, Moore's Byron.

These sparks with awkward *vanity* display
What the fine gentleman wore yesterday.

Something which befalls you may seem a great misfortune;—you . . . begin to think that it is a chastisement, or a warning. . . . But give up this egotistic indulgence of your fancy; examine a little what misfortunes, greater a thousand fold, are happening, every second, to twenty times worthier persons; and your *self-consciousness* will change into pity and humility. *Ruskin*, Ethics of the Dust, v.

See II., 2.—**Egyptian architecture**, the architecture of ancient Egypt, which, among its peculiar monuments, exhibits pyramids, rock-cut temples and tombs, and gigantic monolithic obelisks. The characteristic features of the style are solidity and the majesty attending colossal size. covered ways, flat, and composed of immense blocks of stone, reaching from one wall or stone epistyle beam to another, the arch, although in all its forms of frequent use in drains and similar works, not being employed in architecture above ground, which holds consistently to the system of lintel-construction. (*c*) Columns, numerous, close, and massive, without bases, or with broad, flat, low bases, and exhibiting great variety in their capitals, from a simple square block to a wide-spreading bell, elaborately carved with palm-leaves or other forms suggested by vegetation, especially in some adaptation of the lotus plant, bud, or flower. (*d*) The employment of a large concave molding to crown the entablature, decorated with vertical flutings or leaves. (*e*) Walls and columns decorated with a profusion of sculptures in incised outline, often of admirable precision (see *cavo-rilievo*), or in low relief, representing divinities, men, and animals, with innumerable hieroglyphics, brilliant and true, though simple, coloring being superadded. A remarkable feature of Egyptian architecture is the grandeur of its mechanical operations, as in cutting, polishing, sculpturing, and transporting enormous blocks of limestone and of granite, and in its stupendous excavations in the solid rock. The prototype of the Greek Doric order is to be sought in such Egyptian columnar structures as the grotto-façades of Beni-Hassan; and from the Egyptian lotus carvings and decoration were developed many characteristic Assyrian decorative motives, as well as the Ionic capital and the graceful anthemion-molding of Greece. See *mastaba*, *obelisk*, *pylon*, *pyramid*, *syrinx*, 2, etc.—**Egyptian art**, the architecture, sculpture, and painting of ancient Egypt, one of the most important of the great artistic developments of the world. (See *Egyptian architecture*, above.) The earliest known

Egyptian sculptures, not less than 6,000 years old, exhibit great technical skill, approach nature with remarkable ease and certainty, and far surpass in naturalness the more conventional works which succeeded them. Yet the best Egyptian works of all times possess striking individuality as well as refinement, a very large proportion

of the vast number of portrait statues and reliefs being evidently likenesses, and the physical differences of class, station, and employment, as well as ethnological differences in the countless historical scenes, being clearly rendered. With the advent of the Ptolemies, Greek influences were brought to bear upon Egyptian art, which progressively lost its good qualities without acquiring those of the art of Greece and of Rome. The great Sphinx of Ghizeh is the oldest as well as the largest work of sculpture known; the colossi of Amenhotep (Amenhotpou) III. at Thebes (one of them is the famous Memnon, so called) are about 52 feet high; those of the Rameseum are of the same height; and that of Tanis is nearly 60 feet high. Egyptian painting is strictly illumination, as the colors are laid on flat, without shading or gradation, within a definite outline. The drawing is typically of great beauty, the outlines being firm, accurate, and graceful. In gem-cutting and jewelry, in enamel, in terra-cotta and glass, in the carving of wood and ivory, in metal-working, and in the industrial arts generally, Egyptian artists and artisans displayed great taste and skill, and were enabled by the diffusion of material prosperity to devise and perfect their products in endless diversity.—**Egyptian bean.** See *bean*[1].—**Egyptian black ware,** a name given by Wedgwood to one of his varieties of fine earthenware: same as *basalt ware* (which see, under *basalt*).—**Egyptian blue.** See *blue*.—**Egyptian chlorosis.** See *chlorosis*.—**Egyptian cloth.** Same as *mummy-cloth*.—**Egyptian darkness,** deep or total darkness: in allusion to the ninth plague of Egypt (Ex. x. 21–23).—**Egyptian frog,** a toad. *Halliwell.* [Isle of Wight.]—**Egyptian goose.** See *goose*.—**Egyptian herring.** See *herring*.—**Egyptian lotus.** See *lotus*.—**Egyptian pebble,** a species of agate or jasper.—**Egyptian pebbleware.** See *pebbleware*.—**Egyptian porcelain,** the name given to a ceramic ware of a blue or greenish color, made in the form of small mummy-shaped figures, and, more rarely, of figures of divinities, and cups, goblets, and the like, found in ancient Egyptian tombs. The material seems to have been sand held together by a relatively small amount of potters' clay; this, when fired, turns to an opaque glass or enamel throughout its whole mass. The color is an oxid of copper, which is applied to the surface, and stains the ware very deeply.—**Egyptian vulture.** See *vulture*.—**Egyptian ware,** a variety of Wedgwood ware.

II. *n.* **1.** A native of Egypt; a member of any of the different races constituting the permanent population of Egypt; more specifically, a member or a descendant of the ancient Egyptian race or races, supposed to be now represented chiefly by the Copts and the fellahs or peasantry, as distinguished from the Arabs and other later settlers.—**2†.** A gipsy.

The commercial down is chiefly obtained from the common eider, and is used in the manufacture of many beautiful fabrics, as coverlets, robes, tippets, muffs, etc. It is one of the very poorest conductors of heat, as well as an extremely light substance, thus preserving great warmth with very little weight

duskier shades in small patterns. The down with which these birds line their nests is copious, and is much valued for its extreme lightness, warmth, and elasticity. The birds are practically domesticated in some places. The American bird, a slightly different species from the European, is known as *S. dresseri*; it breeds abundantly in Labrador, Newfoundland, etc. The king eider-duck is a very distinct species, *Somateria* (*Erionetta*) *spectabilis*, the gibbosity of the bill being different in shape, and the head tinged with blue as well as green. The Pacific eider-duck is *S. v-nigrum*, having a black V-shaped mark on the chin, but otherwise resembling the common eider. The spectacled eider-duck, *Somateria* (*Arctonetta*) *fischeri*, inhabits the northern Pacific; its bill is not gibbous, and it has no frontal processes, the feathers reaching beyond the nostrils. Steller's duck, *Heniconetta stelleri*, is often called *Steller's eider*, and sometimes included in the genus *Somateria*. See *Somateria*.

Since 1819 an eisteddfod has been held almost every year. It usually attracts thousands of persons from all parts of the country, and lasts three or four days, which are devoted to orations and contests in poetry, singing, harping, etc.; and prizes are awarded, amid much enthusiasm and ceremony, to the successful competitors. The proceedings are conducted partly in Welsh and partly in English. Similar meetings are sometimes held in the United States by citizens of Welsh origin.

either (ē′тнėr or ī′тнėr: see below), *a.* and *pron.* [< ME. *either, eyther, aither, ayther, ether, æither*, also *eyder, ayder*, etc. (also contr. to *er*, as *other* to *or*), adj., pron. indef. and conj., < AS. *ǣgther*, contr. of *ǣghwæther* (= OFries. *eider, aider*, orig. **aiehweder* = OHG. **ēogahwedar, ēocahwedar, iogahwedar, iogiwedar*, MHG. *iegeweder*, MG. *iquedir, iquedder*), either, each, contr. of the orig. **ā-ge-hwæther*, < *ā-*, ever, in comp. an indef. prefix equiv. to mod. E. *ever-*, + *ge-*, generalizing prefix, + *hwæther*, pron., whether: see *whether*, pron. The forms interchange in ME., in both the pronominal and conjunctional use, with ME. *awther, auther, athir, owther, outher, other*, contr. *or* (whence mod. E. *or*, the correlative of *either*, conj.), < AS. *āhwæther*, contr. *āwther, āuther, āthor* (= OFries. *ahwedder, auder, ouder* = D. *ieder* = MLG. *ieder, ider* = OHG. *ēohwedar, ēowedar, ioweder*, MHG. *ieweder, iweder, ieder*, G. *jeder*), either, each, < *ā-*, ever, in comp. an indef. prefix, + *hwæther*, pron., whether: this form being thus identical, with the exception of the prefix *ge-*, with the first form. Hence, with a negative prefixed, *neither*, q. v. The regular literary pronunciation of *either*, according to history and analogy, is ēтнėr (and so *neither*, nēтнėr); but the dialectal pronunciation āтнėr, which preceded the present literary pronunciation ēтнėr, and the pronunciation īтнėr, which has now some currency even among educated persons, all have historical justification.] **I.** *a.* **1.** Being one or the other of two, taken indifferently or as the case requires: referring to two units or particulars of a class: as, it can be done in *either* way; take *either* apple; the boat will land on *either* side.

> Can *either* sex assume, or both.
> *Milton*, P. L., i. 424.

>
> The pastor was made to take his seat before the altar, with his two sacristans, one on *either* side. *Prescott.*

[In this use, *each* or *both*, according to construction, is nearly if not quite always to be preferred. Properly, *either* refers indefinitely to one or the other of two (and often in actual use, though less accurately, to some one of any number); *each*, definitely to every one of two or any larger number considered individually: a distinctness of signification which ought to be maintained, since interchange of the words (less practised by careful writers now than formerly) offers no advantage, but may create ambiguity. *Both*, two together, one and the other taken jointly, should be preferred when this is the specific sense; but *both* and *each* may often be interchanged. Thus, the camp may be pitched on *either* side of the stream (on one or the other side indifferently); there were two camps, one on *each* side; the camp was pitched on *both* sides (one camp, divided); there are fine buildings on *both* sides of the street, or on *each* side, but not on *either* side.]

II. *pron.* **1.** One or the other; one of two, taken indifferently.

>
> And bothe hostes made to-geder grete ioye, as soone as *eyder* of hem myght sen other. *Merlin* (E. E. T. S.), ii. 148.
>
> Lepidus flatters both,
> Of both is flatter'd; but he neither loves,
> Nor *either* cares for him. *Shak.*, A. and C., ii. 1.

2. Each of two; the one and the other. [See remarks under I., 2.]

> The king of Israel and Jehoshaphat sat *either* of them on his throne. 2 Chron. xviii. 9.
>
> *Either's* heart did ache
> A little while with thought of the old days.
> *William Morris*, Earthly Paradise, II. 294.

See *either, a.* and *pron.*] **1.** In one case;

eject (ē-jekt'), *n.* [< L. *ejectum*, neut. of *ejectus*, pp. of *eicere*, *ejicere*, eject: see *eject*, *v.*] That which is ejected; specifically, in *philos.*, a reality whose existence is inferred, but which is outside of, and from its nature inaccessible to, the consciousness of the one making the inference: thus, the consciousness of one individual is an *eject* to the consciousness of any other.

But the inferred existence of your feelings, of objective groupings among them similar to those among my feelings, and of a subjective order in many respects analogous to my own—these inferred existences are in the very act of inference thrown out of my consciousness, recognized as outside of it, as not being a part of me. I propose, accordingly, to call these inferred existences *ejects*, things thrown out of my consciousness, to distinguish them from objects, things presented in my consciousness, phenomena.
W. K. Clifford, Lectures, II. 72.

W. K. Clifford, Lectures, II. 74.

ejectively (ē-jek'tiv-li), *adv.* **1.** By ejection.—**2.** In *philos.*, as an eject. [Recent.]

★**ejector** (ē-jek'tọr), *n.* One who or that which ejects. Specifically—(*a*) In *law*, one who ejects another from or dispossesses him of his land. (*b*) A device for utilizing the living force of a jet of steam or air under pressure to lift a liquid or a finely divided solid, such as sand, dust, or ashes. In the simplest form two pipes are placed one within the other, the larger one having a conical shape at the place where the smaller one enters it. A jet of steam or air passing from the smaller pipe upward into the larger pipe tends to cause any liquid, as oil or water, within reach to rise in the larger pipe. In oil-wells such a device is used to raise the oil to the surface. In another form of ejector, for lifting water, the smaller pipe enters a bend of the larger pipe near the top, the force of the jet tending to lift water through the pipe from below. The steam-ejector is also used to lift ashes from the furnace-room of a steamer and to discharge them through a pipe passing overboard above the water-line. The ejector is also used to exhaust the air of a vacuum-brake; in this case the steam-jet moves a column of air instead of water. (*c*) A device for throwing cartridge-shells from a firearm after firing. The common ejector of single- and double-barreled breech-loaders is a bolt underneath the gun-barrel, with a head fitted to the rim of the bore, working automatically back and forth in closing and opening the arm; in the latter movement the head catches against the rim of the shell and pushes it out of the barrel. There are many other devices, as a spring-lever, etc.—**Casual ejector.** See *casual*.

Ejector.

eka-. [< Skt. *eka*, one. Cf. *dui-*.] In *chem.*, a prefix attached to the name of an element and forming with it a provisional name for a hypothetical element which, according to the periodic system of Mendelejeff, should have such properties as to stand in the same group with the element to which the prefix is made and next to it. For example, *eka-aluminium* was the provisional name given by Mendelejeff to a hypothetical element which in the periodic system should have such properties as to stand in the same group as aluminium and next to it. The recently discovered element gallium agrees in properties with those ascribed to eka-aluminium, and this name is now abandoned.

It is composed of numerous slender tubes or follicles, which secrete the greasy fluid, and the ducts of which, uniting successively in larger tubes, finally open by one or more pores, commonly upon a little nipple-like elevation. Birds press out a drop of oil with the beak, and dress the feathers with it, in the operation called *preening*. The gland is large and always present in aquatic birds, which have need of a waterproof plumage; it is smaller in land-birds, as a rule, and wanting in some. 2. Having, as a solid body, the power of returning to the form from which it is bent, extended, pressed, pulled, or distorted, as soon as the force applied is removed; having, as a fluid, the property of recovering its former volume after compression. A body is perfectly elastic when it has the property of resisting a given deformation equally, however that deformation may have been produced, whether slowly or suddenly, etc. All bodies, however, have different elasticities at different temperatures, and if the deformation is so sudden as to change the temperature of the body and so alter its resistance to deformation, this is not considered as showing it to be imperfectly elastic.

> For the more easy understanding of the experiments triable by our engine, I thought it not superfluous nor unseasonable, in the recital of this first of them, to insinuate that notion by which it seems likely that most, if not all of them, will prove explicable. Your Lordship will easily suppose that the notion I speak of is that there is a spring, or *elastical* power, in the air we live in. By which ἐλατήρ or spring of the air, that which I mean is this: that our air either consists of, or at least abounds with, parts of such a nature that in case they be bent or compressed by the weight of the incumbent part of the atmosphere, or by any other body, they do endeavor, as much as in them lieth, to free themselves from that pressure, by bearing against the contiguous bodies that keep them bent; and as soon as those bodies are removed, or reduced to give them way, by presently unbending and stretching out themselves, either quite, or so far forth as the contiguous bodies that resist them permit, and thereby expanding the whole parcel of air these *elastical* bodies compose. *Boyle*, Spring of the Air (1659).

★**elater**[2] (el′ą-tėr), *n.* [NL. *elater*, < Gr. ἐλατήρ, a driver, hurler, < ἐλαύνειν (ἐλα-), drive, set in motion: see *elastic*.] 1†. Elasticity; especially, the expansibility of a gas.

It may be said that the swelling of the compressed water in the pewter vessel lately mentioned, and the springing up of the water at the hole made by the needle, were not the effects of an internal *elater* of the water, but of the spring of the many little particles of air dispersed through that water. *Boyle*, Spring of the Air, Exp. xxii.

2. [NL.] In *bot.*: (*a*) One of the four club-shaped filaments of *Equisetaceæ*, attached at one point to a spore, formed by the splitting of the outer coat of the spore. They are strongly hygroscopic, and aid in the dispersion of the spores, also keeping a small group together, as they leave the sporangium. See cut under *Equisetaceæ*. (*b*) One of the long and slender fusiform cells of *Hepaticæ* having one or more spiral thickenings within. They loosen the spores in the capsule at the time of their dispersion. (*c*) One of the similar free filaments of *Myxomycetes* forming part of the capillitium, and frequently having spiral thickenings. They are sometimes furnished with spines. Their characters are useful in distinguishing species.—3. [NL.] In *entom.*: (*a*) [*cap.*] The typical genus of the family *Elateridæ*, founded by Linnæus in 1748. It comprises over 100 species, of which nearly 50 inhabit North America. They are mostly found in temperate regions, on leaves and flowers, or oftener under bark. They are distinguished from members of related genera by the filiform fourth tarsal joint, oblong-oval scutellum, small regularly convex head, and the sinuate single-toothed dilatation of the hind coxæ. (*b*) One of the *Elateridæ*; a click-beetle. (*c*) One of the elastic bristles at the end of the abdomen of the *Poduridæ*. *A. S. Packard*. See *spring*.

II. *n.* One of the *Elateridæ*; a click-beetle, spring-beetle, or skipjack.

Elateridæ (el-ą-ter′i-dē), *n. pl.* [NL., < *Elater*[2], 3 (*a*), + *-idæ*.] A family of sternoxine pentamerous beetles, corresponding to the Linnean genus *Elater*. The ventral segments are typically free, the first not being elongated; the tarsi are 5-jointed; the prothorax is loosely jointed to the mesothorax; the prosternum is prolonged behind; the globose front coxæ are within the prosternum; the hind coxæ are contiguous, laminate, and sulcate; the free ventral segments are 5 or rarely 6 in number; the labrum is free and visible; and the antennæ are usually serrate, sometimes filiform, pectinate, or flabellate. The species are very numerous, and are known as *click-beetles*, *snapping-beetles*, *spring-beetles*, and *skipjacks*. Their legs are short, and when they are placed on their backs on a flat surface they right themselves with an audible snapping of their bodies. This is effected by means of the spine of the prosternum, which acts as a spring on the mesosternum, and the force being transmitted to the base of the elytra, and so to the supporting surface, the insects are jerked into the air and manage to fall on their feet. The force is remarkable, as one may experience by trying to hold one of the larger species. (See cut under *click-beetle*.) The fireflies of tropical regions are elaters, as of the genus *Pyrophorus*. (See cut under *antenna*.) The larvæ of many species are known as *wireworms*, and are very injurious to crops. See cut under *wireworm*.

elaterin, elaterine (e-lat′e-rin), *n.* [< *elater-ium* + *-in*[2], *-ine*[2].] A neutral principle ($C_{20}H_{28}O_5$) extracted by alcohol from elaterium. When pure it forms colorless hexagonal crystals, which are odorless and have a bitter, acrid taste. It is used in medicine in minute doses as a very powerful hydragogue cathartic.

elaterist (e-lat′e-rist), *n.* [< *elater*[2] + *-ist*.] One who holds that many of the phenomena connected with the air-pump are to be explained by the elasticity of the air, and who maintains the truth of Boyle's law that the density of a gas is proportional to the pressure.

Although our authour [Linus] confesses that air has a spring as well as a weight, yet he resolutely denies that spring to be near great enough to perform those things which his adversaries (whom for brevity sake we will venture to call *elaterists*) ascribe to it.
Boyle, Defence against Linus, ii.

elaterite (e-lat′e-rīt), *n.* [< *elater-ium* + *-ite*.] An elastic mineral resin of a blackish-brown color, subtranslucent, and occurring in soft flexible masses. Also called *elastic bitumen* and *mineral caoutchouc*.

A substance obtained from the fruit of the *Ecballium Elaterium*, or squirting cucumber, which, if it is gathered a little before it ripens, and the juice gently expressed, deposits a green sediment, which is collected and dried. Good elaterium operates as a drastic purge, and is generally administered in cases of dropsy. It contains elaterin, together with starch, resin, etc.

Sir R. L'Estrange.

3. In the Old Testament, a title of indefinite signification applied to various officers, but generally indicating in the earlier history the princes or heads of tribes, and afterward men of special influence, dignity, and authority in their local community. In the New Testament the elders are the lay element in the Sanhedrim, the supreme court of the Jewish nation in the first century.

Gather unto me all the *elders* of your tribes, and your officers, that I may speak these words in their ears.
Deut. xxxi. 28.

Her husband is known in the gates, when he sitteth among the *elders* of the land. Prov. xxxi. 23.

In the first instance, at any rate originally, the head of the first house was always the head of the clan, that of the first clan also that of the tribe. All these three grades of the heads of the people, who would thus reach the total of 1,728, might certainly be also designated by one common name, and in all probability this was furnished by the name "head" or "father," also more definitely the "head of the fathers," but more frequently by the name we so often meet with of *elder*.
Ewald, Antiq. of Israel (trans.), p. 245.

4. In the New Testament, also the title of certain officers in the Christian church, whose functions are not clearly defined, but who apparently exercised a considerable control in the conduct of the local churches. Scholars are not agreed as to the limits or nature of their authority. The Presbyterians maintain that there were two classes of elders (1 Tim. v. 17; 1 Cor. xii. 28; Rom. xii. 6–8; Acts xv. 25, 26, xx. 28; Heb. xiii. 7, 17). The Congregationalists on the one hand, and the Episcopalians on the other, maintain that there was no distinction between ruling and teaching elders, the elder or presbyter being in their judgment identical with the pastor or shepherd of the flock (Acts xx. 28; 1 Thes. v. 12; Heb. xiii. 7, 17; 1 Tim. v. 17).

Elder is the translation of the equivalent word, which we still preserve in its Greek form of presbyter, and which is contracted through the old French forms prester and prestre, into priest. *Smith*, N. T. Hist., p. 447, note.

5. In certain Protestant churches, an officer exercising governmental functions, either with or without teaching or pastoral functions. (*a*) In churches of the Baptist persuasion the pastors of churches are usually called *elders*, although the class especially so called are not settled pastors, but evangelists and missionaries. (*b*) (1) In churches of the Presbyterian order the pastor of a church is technically called the *teaching elder*, as distinguished from the *ruling elders*, commonly called simply *elders*, who are a body of laymen, varying in number, selected to assist the pastor in the oversight and government of the church. The board of ruling elders constitute with the pastor the session of the church, and are intrusted with its government and discipline, subject to the supervision of the Presbytery. Such elders are required to accept the Symbol or Confession of Faith of the Presbyterian Church; they do not administer the sacraments, but aid in the Lord's supper by distributing the elements. They are sometimes elected for life, sometimes only for a term of years. (2) In the early days of Congregationalism many churches had, besides the pastor and teacher, a *ruling elder*, charged with matters of church government and discipline.

The congregation at Watertown (whereof Mr. George Phillips was pastor) had chosen one Richard Brown for their *elder*. *Winthrop*, Hist. New England, I. 81.

I judg it not lawfull for you, being a *ruling Elder*, . . . opposed to the Elders that teach & exhorte and labore in ye word and doctrine, to which ye sacrements are annexed, to administer them, nor convenient if it were lawfull.
Robinson, Quoted in Bradford's Plymouth Plantation, [p. 167.

(*c*) In some bodies of American Methodists *elder* is used of any clergyman. In the Methodist Episcopal Church the *presiding elder* (now *district superintendent*) is appointed by and serves under the bishop as superintendent, with large though carefully defined supervisory powers within a specified "district," which usually corresponds somewhat in extent to an average county in an eastern State. In this district every minister is amenable to him, and every church is subject to his supervision and is usually visited by him three or four times during the year. He presides at Quarterly and often at District Conferences. *Traveling elders* are itinerant preachers appointed by the Annual Conference. (*d*) In the Mormon Church the *elder* is an officer whose duty it is "to preach and baptize; to ordain other elders, and also priests, teachers, and deacons; to lay on hands for the gift of the Holy Ghost; to bless children; and to take the lead of all meetings." The elders constitute the Melchizedek priesthood, and include the apostles, the Seventy, the evangelists or patriarchs, and the high priest. *Mormon Catechism*, xvii. (*e*) Among the Shakers, four *elders*, two males and two females (the latter also called *eldereresses*), have charge of each of the ★aggregated families.

The persons voted for are called *candidates*, or, with reference to their selection as candidates, *nominees*. The decision may depend upon the casting of an actual majority of all the votes for a candidate, as in various European countries and in some of the United States, or upon a plurality or the largest number of votes for any candidate where there are more than two opposing candidates, as in most of the United States. In the former case a new election has to be held when there is no actual majority; in the latter a single balloting is final unless there is a tie, which is very rare.

In free governments the people, or such of them as possess the prescribed qualifications, are the electors of their legislative representatives, and in some, as the United States, of their principal executive officers, and in some cases of their judicial officers.

Specifically — (*a*) In the Roman-German empire, one of the seven or more princes who had the right to elect the emperor. As established by the Golden Bull of 1356, these were the spiritual electors of Mayence, Treves, and Cologne, and the temporal electors of the Rhine Palatinate, Saxony, Brandenburg, and Bohemia. Other German princes, as the rulers of Bavaria, Hanover, etc., also had voices in the college of electoral princes for longer or shorter periods. The original electors held also the great magisterial offices of the imperial court. The whole system passed away with the empire in 1806. The temporal princes holding the right were generally known by the title of *elector* in their several dominions.

Presidential electors, persons elected by the voters of the several States for the purpose of electing the next President and Vice-President of the United States. Originally they were expected to exercise some independent choice among members of each party represented in their body; but in practice their function soon became merely that of casting votes predetermined by party nomination. Each State has as many electors as it has representatives and senators in Congress. No person holding an office under the United States government is eligible for an elector. — **The Great Elector**, the name usually given to Frederick William, Elector of Brandenburg from 1640 to 1688, who greatly strengthened the Brandenburg-Prussian power, and prepared the way for the elevation of the Prussian monarchy under Frederick the Great.

Electoral commission, in *U. The occasion for the disagreement was the opposite views taken by the respective parties as to the relative validity of different sets of electoral votes returned from the lately seceded States of Louisiana, South Carolina, and Florida, and also from Oregon, which would decide the election. The result was the seating of the Republicans Hayes and Wheeler, as against the Democrats Tilden and Hendricks. — **Electoral crown**, the crown worn by the electors of the Roman-German empire, represented as arched with four half-circles supporting an orb and a cross, and doubled or faced with ermine, which turns up round the lower rim and has a scalloped edge, and with two fillets hanging down on the two sides. — **Electoral mantle**, a mantle worn as a mark of office by the electors of the Roman-German empire.

See *alarm, thermostat,* and *fire-alarm.*—**Electric annunciator,** an apparatus by means of which the location of the point at which an electric circuit is made or broken is indicated. A number of electromagnets are connected, each with some particular station, room, or point from which a signal may come; the opening or closing of the circuit at any of these points operates the electromagnet to which it is joined, bringing into view a number, letter, or word indicating the location of the point. The light is of two general kinds, the *arc-light* and the *incandescent light.* In the first the voltaic arc is employed; in the second a resisting conductor is rendered incandescent by the current. The arc-light (see *voltaic arc*, under *arc*[1]) is produced when a current passes between two carbon electrodes, at first in contact and afterward separated a short distance, the result being the formation of the voltaic arc. The light of the arc and the glowing carbon-points has great intensity, and electric lamps of this kind are extensively used for purposes of illumination, where a powerful light can be economically employed. In order to keep the carbon electrodes at a constant distance, so that the light may be uniform, some form of regulator is generally needed. Commonly an electromagnet is used for this purpose. As the carbons are slowly consumed the distance between them increases; current or voltage changes thereby, and the electromagnet, actuated by the current (series-lamp) or the voltage (shunt-lamp) or both, operates, and thus through some mechanical device causes the points to approach each other. In electric candles this necessity is done away with; here, as in the Jablochkoff candle, for example, the carbon pencils are placed side by side, separated by some insulating earthy substance, the arc is formed at the top, and the candle burns away in a manner analogous to that of an ordinary candle. With these candles alternating currents are employed to obviate the difficulty that would otherwise arise from the more rapid consumption of the carbon forming the positive pole. In an incandescent electric lamp, or glow-lamp, the current is made to pass through a strip of some substance which, because of its high resistance, becomes highly heated, and hence brilliantly incandescent. The substance most commonly used is carbon, which in the form of a thin strip or wire, carefully prepared for the purpose (by squirting from a cellulose solution) and bent in a loop, is inclosed in a bulb of glass from which the air has been exhausted. The vacuum is essential to prevent the consumption of the carbon at the high temperature to which it is raised. The incandescent light is comparable in brilliancy to a good gas-burner, and is hence suitable for general house illumination; it is superior to gas in steadiness, and has the great advantage that it does not vitiate the air. The current employed has, for lamps of ordinary power, much less strength than that needed for the arc-light. Besides carbon, some other substances have been used to a limited extent, as osmium. A considerable use has been made of the Nernst lamp, which uses a short rod of refractory oxids as glower, and does not employ a vacuum, but requires as part of the lamp an electric heater, since the glower becomes conducting only when hot.—**Electric log,** a ship's log in which the recording mechanism may be stopped by closing an electrical circuit through the tow-line when it is necessary to haul the log on board ship. Another form of electric log uses the recording mechanism to close a circuit through the tow-line, and report the record of the log on the vessel. See *log.*—**Electric machine,** a machine for generating large quantities of electricity. Those commonly used for producing statical electricity depend upon either friction or induction for their operation. For producing current electricity a magneto-electric or dynamo-electric machine is employed. The frictional electric machine usually consists of a plate or cylinder of glass, which is made by means of a handle to revolve between stationary cushions whose surfaces are covered with amalgam. One form of electricity (positive) is generated on the revolving plate, and is taken off by combs to a large brass cylinder called the *prime conductor;* the other (negative) is generated on the cushions, and may also be collected on a conductor, but is generally allowed to pass off to the earth through a metallic chain. The electricity obtained is the equivalent of the mechanical energy expended in turning the crank, less that which through friction is expended in producing useless heat. An induction-machine acts upon the principle of induction. Thus, in the Holtz machine no friction is used except to charge the armatures. It consists of a stationary glass plate with two open spaces, or "windows," on opposite sides of the center, and of a second glass plate which is revolved very rapidly in front of it. On the other side of the movable plate, and opposite the windows, are two combs connecting with brass conductors ending in large knobs. On one edge of each window is attached a piece of paper, called the *armature*, and a tongue of paper projects from it into the open space toward the revolving wheel. In the use of the Holtz machine and others of the same kind a small initial charge must first be communicated to the armature. By influence this is increased until a maximum, depending on the insulating power of the machine and its supports, is reached. The electrical energy developed has its equivalent in the work done in overcoming alternate attraction and repulsion of the moving and fixed parts. The effects of an influence-machine are much more powerful than those of the plate-machine, and it is less influenced by dampness in the air. It is consequently a very useful machine in the physical laboratory, being much used for statical experiments. When a powerful current of electricity is required, a magneto-electric or dynamo-electric machine driven by a steam- or gas-engine, or by water-power, is employed. These machines depend upon the induction which takes place between magnets and coils of wire, when their relative positions are changed. (See *induction.*) The distinction between the magneto- and dynamo-machines is that in the former a permanent magnet is employed, while in the latter its place is taken by an electromagnet. A simple form of the first consists of a large horseshoe magnet, before the poles of which two bobbins wound with insulated copper wire and inclosing cores of soft iron are made to revolve; the variation in magnetic intensity and polarity as these soft iron cores alternately approach and recede from the poles of the permanent magnet produces induced currents in the wire of the bobbins. These currents are reversed for each half-revolution, and hence a machine of this type produces an alternating current. This current may either be used as such, or, by means of a commutator, may be directed so as to pass through the external circuit always in the same direction. Dynamo-electric machines are thereby divided into *direct-current* and *alternating-current machines.* They are called *generators* when changing mechanical into electric power, *motors* when changing electric into mechanical power, and *converters* when changing electric into another form of electric power, as alternating into direct. By the character of the electric power they are divided into *constant-potential* and *constant-current* machines; by the excitation of their magnetic fields into *shunt-, series-, compound* and *separately excited* machines; by their construction into *bipolar* and *multipolar, revolving-armature* and *revolving-field* machines; by their method of driving into *direct-connected* and *belted* machines. Direct-current machines usually consist of an even number of electromagnets, circularly arranged around an armature, which revolves between their poles and carries a commutator, from which by the brushes, usually of carbon, a direct current is taken off, in a generator, sent in, in a

motor. Alternators usually consist of a revolving system of electromagnets or field-poles, which point outward star-shaped, and revolve inside of a stationary armature. Induction-machines consist of an armature, the circuits of which are closed upon themselves, and a field, usually without definite poles, which is excited by the alternating current. Constant-current machines are used only for arc lighting. For long-distance power transmission only alternators are used; for lighting, alternating- as well as direct-current machines. The illustration shows a constant-current or arc machine. Dynamos have a high degree of efficiency, many transforming over 90 per cent. of the mechanical energy used in revolving the armature into the energy of the electric current. They furnish the electric current much more economically, as well as more regularly, than a voltaic battery, since the zinc, the fuel of the latter, is an expensive and a poor fuel, as compared with the coal used for the engine which drives the dynamo.—**Electric meter,** an instrument designed to measure the quantity of electricity supplied to consumers for the production of light or heat, or to be used as a motive power.—**Electric motor.** See *electric machine.*—**Electric organ.** See *organ.*—**Electric pendulum,** a form of electroscope consisting of a pith-ball suspended by a non-conducting thread.—**Electric piano.** See *piano.*—**Electric railway,** a railway on which electricity is the motive power. In one the electric motor is actuated by a current of electricity drawn from a secondary or "storage" battery carried with the car, generally underneath the floor; in the other the current is conveyed from a dynamo at some point on the line by means of conductors, which may be supported upon poles or placed in an underground conduit.—**Electric storm,** a violent disturbance of the electrical condition of the earth, resulting in strong earth-currents through long lines of telegraph, often interfering with the ordinary working of the line. electricity (ē-lek-tris'i-ti), *n.* [= D. *elektriciteit* = G. *elektricität* = Dan. Sw. *elektricitet* = F. *électricité* = Sp. *electricidad* = Pg. *electricidade* = It. *elettricità,* < NL. *electricita(t-)s,* < *electricus,* electric: see *electric.*] In *physics,* a name denoting the cause of an important class of phenomena of attraction and repulsion, chemical decomposition, etc., or, collectively, these phenomena themselves. Electricity was formerly considered as having the nature of a fluid—either a single fluid, as was supposed by Franklin, or two fluids (positive and negative), as assumed by Symmer. These theories were subsequently displaced by the work of Faraday, Maxwell, Hertz, and others who held that electric and magnetic phenomena are due to deformations or perturbations in the luminiferous ether. More recently there has been a tendency to return to the idea, in a modified form, of a special medium of corpuscular structure the ultimate particles of which are termed 'electrons,' whose presence in and movements through the ether give rise to electric and magnetic forces. The word was first used by Gilbert, the creator of the science of electricity, and by him was applied to the phenomena of attraction and repulsion as exhibited when amber (electrum) and some other substances of a similar character were briskly rubbed. Its meaning has been gradually extended to include a large variety of phenomena, among which may be named heating, luminous and magnetic effects, chemical decomposition, etc., together with numerous apparent attractions and repulsions of matter widely differing from those originally noted, but all of which are attributed to a common cause. The subject is usually divided into the two parts of *statical* or *frictional electricity,* including the electricity produced by friction and analogous means, the phenomena of which are chiefly statical, and *current electricity* (also called *voltaic electricity*), including that produced by the chemical or voltaic battery and electromagnetic machines, the phenomena of which are mostly dynamical. The form of electricity first discovered was the frictional. The discovery is generally attributed to Thales (sixth century B. C.), who observed that amber, after being rubbed by silk, had the property of attracting light bodies, like bits of paper, bran, etc. It was subsequently discovered that glass, sulphur, resin, and many other bodies gained by friction this same property to a greater or less extent. When electricity is produced by the friction of silk on glass, that of the glass is called *vitreous* or *positive electricity,* while that of the silk rubber is called *resinous* or *negative electricity.* When produced by the friction of flannel or silk on sealing-wax, that of the wax is *negative,* and that of the flannel or silk rubber is *positive.* This distinction, which, however, is properly explained as due to a difference of electrical potential (see *potential*), extends through the whole subject, by whatever means the electricity is produced. It is found that the two kinds of electricity are produced in equal amounts. Besides friction, there are other means of exciting electricity, as electrostatic induction or influence, pressure between two bodies, or sudden fracture (sugar becomes faintly luminous when broken in the dark). If a piece of sealing-wax is broken, the opposite ends will be found to be dissimilarly electrified. This is especially true of the fracture of cleavable minerals, like mica, calcite, etc. Some crystallized bodies become electrified by change of temperature: for example, a crystal of tourmalin, on being slightly warmed, becomes positively electrified at one extremity, and negatively at the other; if cooled, the poles are reversed. (See *pyro-electricity.*) For the chief means of obtaining a supply of frictional electricity, see *electric machine,* under *electric,* and *electrophorus.* The principal subjects considered under the head of statical electricity are the distribution of electricity over the surface of a conductor, as determined by its shape or the proximity of other electrified bodies (see *density*); the effect of induction or the production of an electrified state in a neutral body by approaching it to one already electrified, but without contact; the degree of induction, as determined by the nature of the non-conductor or dielectric (see *induction, conductor, dielectric*); the accumulation of electricity in a condenser, as a Leyden jar (see *condenser,* and *Leyden jar,* under *jar*); the measurement of capacity, potential, quantity, etc. (as with an electrometer); and the phenomena of discharge, as the spark-discharge, which takes place between oppositely electrified bodies when they are brought near together, the brush-discharge, etc. The electricity generated by friction and analogous means is in a state of high potential (see *potential*), but the quantity, and therefore the amount of electrical energy, is generally small; it has the power of overcoming great resistances and producing violent mechanical effects, as seen in the discharge of a Holtz machine, and still more strikingly in the case of lightning. Frictional electricity has found but few useful applications in the arts. The common means of producing current electricity is the dynamo-electric machine, and also the voltaic battery. (See *battery* and *cell.*) In the dynamo-electric machine, electric potential and thereby current is obtained by revolving a system of conductors, or wire coils, relatively to a magnetic field (that is, poles of electromagnets) so as to cut the lines of magnetic force (see *dynamo-electric machine* in the supplement). A current may also be produced by soldering together two ends of two bars of different metals, connecting the other ends with a copper wire, and then heating (or cooling) the first point of union. This is called *thermo-electricity,* and the pair of metals is called a *thermo-electrical couple;* it is analogous to the voltaic couple, only here the electrical current is obtained at the expense of the heat supplied. (See *thermo-electricity.*) The principal subjects considered under the head of current electricity are the production of mechanical motion in the stationary electric motor and the electric railway, the effects of the current in causing chemical decomposition (see *electrolysis, electrometallurgy*), in producing heat and light through the resistance of the medium, including the voltaic arc, and in the production of induced currents in a coil of wire, under certain conditions, by the action of another current or a magnet (see *induction*); the measurement of strength of current (as with a galvanometer or *ampere-meter,* which see), of electromotive force (as with a volt-meter), and of resistance (as with the electric bridge or ohm-meter), etc. The current electricity produced by the dynamo-machine does not differ from that of the electrostatic machine except quantitatively, in that the electric power furnished by even a small dynamo-electric machine is very many times larger than that produced by the friction machine.

Animal electricity. See *animal.*—**Contact theory of electricity,** a theory that the electromotive force of a voltaic cell, and perhaps the electricity produced by friction, is due to the difference of potential assumed by two dissimilar substances when placed in contact.—**Diffusion of electricity.** See *diffusion.*—**Distribution of electricity.** See *distribution.*—**Electrostatic units of electricity.** See *electrostatic.*—**Excitation of electricity.** See *excitation.*—**Free** and **bound electricity.** By a "free" charge of electricity is generally meant one which is borne by an insulated body independently of surrounding objects, while a "bound" charge is one held in position by the presence and attraction of a charge of the opposite character or sign upon a neighboring body. As a matter of fact all charges are "bound," the production of a given quantity of one kind of electricity being always accompanied by the production of the same quantity of the opposite kind. When this complementary charge is very distant and widely distributed, as on the walls of a room, the first may be said to be "free" electricity.
